Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Preface

NOTICE TO CUSTOMERS

All documentation becomes dated, and this manual is no exception. Microchip tools and documentation are constantly evolving to meet customer needs, so some actual dialogs and/or tool descriptions may differ from those in this document. Please refer to our web site (www.microchip.com) to obtain the latest documentation available.

Documents are identified with a “DS” number. This number is located on the bottom of each page, in front of the page number. The numbering convention for the DS number is “DSXXXXX A”, where “XXXXX” is the document number and “A” is the revision level of the document.

For the most up-to-date information on development tools, see the MPLAB® IDE on-line help. Select the Help menu, and then Topics to open a list of available on-line help files.

INTRODUCTION

This chapter contains general information that will be useful to know before using the MPLAB C32 C Compiler. Items discussed in this chapter include:

• Document Layout
• Conventions Used in this Guide
• Recommended Reading
• The Microchip Web Site
• Development Systems Customer Change Notification Service
• Customer Support
• Document Revision History

DOCUMENT LAYOUT

This document describes how to use the MPLAB C32 C Compiler as a development tool to emulate and debug firmware on a target board. The document layout is as follows:

• Chapter 1. Language Specifics – discusses command line usage of the MPLAB C32 C compiler, attributes, pragmas, and data representation
• Chapter 2. Library Environment – discusses using the MPLAB C32 C libraries
• Chapter 3. Interrupts – presents an overview of interrupt processing
• Chapter 4. Low Level Processor Control – discusses access to the low level registers and configuration of the PIC32MX devices
• Chapter 5. Compiler Runtime Environment – discusses the MPLAB C32 C compiler runtime environment
• Appendix A. Implementation Defined Behavior – discusses the choices for implementation defined behavior in MPLAB C32 C compiler
• Appendix B. Open Source Licensing – gives a summary of the open source licenses used for portions of the MPLAB C32 C compiler package
CONVENTIONS USED IN THIS GUIDE

This manual uses the following documentation conventions:

### DOCUMENTATION CONVENTIONS

RECOMMENDED READING

This user's guide describes how to use MPLAB C32 C Compiler. Other useful documents are listed below. The following Microchip documents are available and recommended as supplemental reference resources.

Readme Files
For the latest information on Microchip tools, read the associated Readme files (HTML files) included with the software.

Device-Specific Documentation
The Microchip website contains many documents that describe 16-bit device functions and features. Among these are:

- Individual and family data sheets
- Family reference manuals
- Programmer's reference manuals

MPLAB® C32 C Compiler Libraries (DS51685)
Reference guide for MPLAB C32 libraries and precompiled object files. Lists all library functions provided with the MPLAB C32 C compiler with detailed descriptions of their use.

PIC32MX Configuration Settings
Lists the Configuration Bit Settings for the Microchip PIC32MS devices supported by the MPLAB C32 C compiler’s #pragma config.

C Standards Information
American National Standard for Information Systems – Programming Language – C.
American National Standards Institute (ANSI), 11 West 42nd. Street, New York, New York, 10036.

This standard specifies the form and establishes the interpretation of programs expressed in the programming language C. Its purpose is to promote portability, reliability, maintainability and efficient execution of C language programs on a variety of computing systems.

C Reference Manuals

GCC Documents
http://gcc.gnu.org/onlinedocs/
http://sourceware.org/binutils/
THE MICROCHIP WEB SITE

Microchip provides online support via our web site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user’s guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives
DEVELOPMENT SYSTEMS CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip’s customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

The Development Systems product group categories are:

- **Compilers** – The latest information on Microchip C compilers and other language tools. These include the MPLAB C18, MPLAB C30 and MPLAB C32 C compilers; MPASM™ and MPLAB ASM30 assemblers; MPLINK™ and MPLAB LINK30 object linkers; and MPLIB™ and MPLAB LIB30 object librarians.

- **Emulators** – The latest information on Microchip in-circuit emulators. This includes the MPLAB REAL ICE™ and MPLAB ICE 2000 in-circuit emulators.

- **In-Circuit Debuggers** – The latest information on the Microchip in-circuit debuggers. These include MPLAB ICD 2 and PICkit™ 2.

- **MPLAB® IDE** – The latest information on Microchip MPLAB IDE, the Windows® Integrated Development Environment for development systems tools. This list is focused on the MPLAB IDE, MPLAB IDE Project Manager, MPLAB Editor and MPLAB SIM simulator, as well as general editing and debugging features.

- **Programmers** – The latest information on Microchip programmers. These include the MPLAB PM3 device programmer and the PICSTART® Plus, PICkit™ 1 and PICkit™ 2 development programmers.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

DOCUMENT REVISION HISTORY

Revision A (October 2007)

- Initial Release of this document.
Chapter 1. Language Specifics

1.1 INTRODUCTION

This chapter discusses command line usage of the MPLAB C32 C compiler, attributes, pragmas and data representation.

1.2 HIGHLIGHTS

Items discussed in this chapter are:

- Overview
- File Naming Conventions
- Data Storage
- Predefined Macros
- Attributes and Pragmas
- Command Line Options
- Compiling a Single File on the Command Line
- Compiling Multiple Files on the Command Line

1.3 OVERVIEW

The compilation driver program (pic32-gcc) compiles, assembles and links C and assembly language modules and library archives. Most of the compiler command line options are common to all implementations of the GCC toolset. A few are specific to the MPLAB C32 C compiler.

The basic form of the compiler command line is:

```
pic32-gcc [options] files
```

**Note:** Command line options and file name extensions are case sensitive.

The available options are described in Section 1.8 “Command Line Options”.

For example, to compile, assemble and link the C source file **hello.c**, creating the absolute executable **hello.out**.

```
pic32-gcc -o hello.out hello.c
```

1.4 FILE NAMING CONVENTIONS

The compilation driver recognizes the following file extensions, which are case sensitive.

**TABLE 1-1: FILE NAMES**

<table>
<thead>
<tr>
<th>Extensions</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>file.c</td>
<td>A C source file that must be preprocessed.</td>
</tr>
<tr>
<td>file.h</td>
<td>A header file (not to be compiled or linked).</td>
</tr>
<tr>
<td>file.i</td>
<td>A C source file that has already been pre-processed.</td>
</tr>
<tr>
<td>file.o</td>
<td>An object file.</td>
</tr>
<tr>
<td>file.s</td>
<td>An assembly language source file.</td>
</tr>
</tbody>
</table>
1.5 DATA STORAGE

1.5.1 Storage Endianness

MPLAB C32 C compiler stores multi-byte values in little-endian format. That is, the least significant byte is stored at the lowest address.

For example, the 32-bit value \(0x12345678\) would be stored at address \(0x100\) as:

<table>
<thead>
<tr>
<th>Address</th>
<th>0x100</th>
<th>0x101</th>
<th>0x102</th>
<th>0x103</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>0x78</td>
<td>0x56</td>
<td>0x34</td>
<td>0x12</td>
</tr>
</tbody>
</table>

1.5.2 Integer Representation

Integer values in MPLAB C32 C compiler are represented in 2's complement and vary in size from 8 to 64 bits. These values are available in compiled code via \texttt{limits.h}.

<table>
<thead>
<tr>
<th>Type</th>
<th>Bits</th>
<th>Min</th>
<th>Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>char, signed char</td>
<td>8</td>
<td>-128</td>
<td>127</td>
</tr>
<tr>
<td>unsigned char</td>
<td>8</td>
<td>0</td>
<td>255</td>
</tr>
<tr>
<td>short, signed short</td>
<td>16</td>
<td>-32768</td>
<td>32767</td>
</tr>
<tr>
<td>unsigned short</td>
<td>16</td>
<td>0</td>
<td>65535</td>
</tr>
<tr>
<td>int, signed int, long, signed long</td>
<td>32</td>
<td>-2^{31}</td>
<td>2^{31} - 1</td>
</tr>
<tr>
<td>unsigned int, unsigned long</td>
<td>32</td>
<td>0</td>
<td>2^{32} - 1</td>
</tr>
<tr>
<td>long long, signed long long</td>
<td>64</td>
<td>-2^{63}</td>
<td>2^{63} - 1</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>64</td>
<td>0</td>
<td>2^{64} - 1</td>
</tr>
</tbody>
</table>

1.5.3 Signed and Unsigned Character Types

By default, values of type plain \texttt{char} are signed values. This behavior is implementation-defined by the C standard, and some environments\(^1\) define a plain char value to be unsigned. The command line option \texttt{-funsigned-char} can be used to set the default type to unsigned for a given translation unit.

1.5.4 Floating-Point Representation

MPLAB C32 C compiler uses the IEEE-754 floating-point format. Detail regarding the implementation limits is available to a translation unit in \texttt{float.h}.

<table>
<thead>
<tr>
<th>Type</th>
<th>Bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>float</td>
<td>32</td>
</tr>
<tr>
<td>double</td>
<td>64</td>
</tr>
<tr>
<td>long double</td>
<td>64</td>
</tr>
</tbody>
</table>

1.5.5 Pointers

Pointers in MPLAB C32 C compiler are all 32 bits in size.

\(^1\) Notably, PowerPC and ARM
### 1.5.6 limits.h

The `limits.h` header file defines the ranges of values which can be represented by the integer types.

<table>
<thead>
<tr>
<th>Macro name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHAR_BIT</td>
<td>8</td>
<td>The size, in bits, of the smallest non-bitfield object.</td>
</tr>
<tr>
<td>SCHAR_MIN</td>
<td>-128</td>
<td>The minimum value possible for an object of type <code>signed char</code>.</td>
</tr>
<tr>
<td>SCHAR_MAX</td>
<td>127</td>
<td>The maximum value possible for an object of type <code>signed char</code>.</td>
</tr>
<tr>
<td>UCHAR_MAX</td>
<td>255</td>
<td>The maximum value possible for an object of type <code>unsigned char</code>.</td>
</tr>
<tr>
<td>CHAR_MIN</td>
<td>-128 (or 0, see Signed and Unsigned Character Types)</td>
<td>The minimum value possible for an object of type <code>char</code>.</td>
</tr>
<tr>

</tbody>
</table>
## 1.6 PREDEFINED MACROS

### 1.6.1 MPLAB C32 C Compiler Macros

MPLAB C32 C compiler defines a number of macros, most with the prefix "-_MCHP_," which characterize the various target specific options, the target processor and other aspects of the host environment.

<table>
<thead>
<tr>
<th>Macro</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_MCHP_SZINT</td>
<td>32 or 64, depending on command line options to set the size of an integer (-mint32 -mint64).</td>
</tr>
<tr>
<td>_MCHP_SZLONG</td>
<td>32 or 64, depending on command line options to set the size of an integer (-mlong32 -mlong64).</td>
</tr>
<tr>
<td>_MCHP_SZPTR</td>
<td>32 always since all pointers are 32 bits.</td>
</tr>
<tr>
<td>__mchp_no_float</td>
<td>Defined if -mno-float specified.</td>
</tr>
<tr>
<td>__NO_FLOAT</td>
<td>Defined if -mno-float specified.</td>
</tr>
<tr>
<td>__SOFT_FLOAT</td>
<td>Indicates that floating-point is supported via library calls.</td>
</tr>
<tr>
<td><strong>pic</strong></td>
<td>The translation unit is being compiled for position independent code.</td>
</tr>
<tr>
<td>__PIC32MX</td>
<td>Always defined.</td>
</tr>
<tr>
<td>__LANGUAGE_ASM</td>
<td>Defined if compiling a pre-processed assembly file (.S files).</td>
</tr>
<tr>
<td>__LANGUAGE_C</td>
<td>Defined if compiling a C file.</td>
</tr>
<tr>
<td><strong>processor</strong></td>
<td>Where &quot;processor&quot; is the capitalized argument to the -mprocessor option. E.g., -mprocessor=32mx12f3456 will define <strong>32MX12F3456</strong>.</td>
</tr>
</tbody>
</table>

### 1.6.2 SDE Compatibility Macros

The MIPS SDE (Software Development Environment) defines a number of macros, most with the prefix "-_MIPS_," which characterize various target specific options, some determined by command line options (e.g., -mint64). Where applicable, these macros will be defined by the MPLAB C32 C compiler in order to ease porting applications and middleware from the SDE to MPLAB C32 C compiler.

<table>
<thead>
<tr>
<th>Macro</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_MIPS_SZINT</td>
<td>32 or 64, depending on command line options to set the size of an integer (-mint32 -mint64).</td>
</tr>
<tr>
<td>_MIPS_SZLONG</td>
<td>32 or 64, depending on command line options to set the size of an integer (-mlong32 -mlong64).</td>
</tr>
<tr>
<td>_MIPS_SZPTR</td>
<td>32 always since all pointers are 32 bits.</td>
</tr>
<tr>
<td>__mips_no_float</td>
<td>Defined if -mno-float specified.</td>
</tr>
</tbody>
</table>
1.7 ATTRIBUTES AND PRAGMAS

1.7.1 Function Attributes

**always_inline**
If the function is declared `inline`, always inline the function, even if no optimization level was specified.

**longcall**
Always invoke the function by first loading its address into a register and then using the contents of that register. This allows calling a function located beyond the 28 bit addressing range of the direct call instruction.

**far**
Functionally equivalent to `longcall`.

**near**
Always invoke the function with an absolute call instruction, even when the `-mlong-calls` command line option is specified.

**mips16**
Generate code for the function in the MIPS16 instruction set.

**nomips16**
Always generate code for the function in the MIPS32 instruction set, even when compiling the translation unit with the `-mips16` command line option.

**interrupt**
Generate prologue and epilogue code for the function as an interrupt handler function. See Chapter 3. “Interrupts” and Section 3.5 “Exception Handlers”.

**vector**
Generate a branch instruction at the indicated exception vector which targets the function. See Chapter 3. “Interrupts” and Section 3.5 “Exception Handlers”.

<td>_mips_single_float</td>
<td>_mips, _mips16, _mips16e</td>
</tr>
<tr>
<td></td>
<td>Defined if -msingle-float specified.</td>
</tr>
</tbody>
</table>
at_vector
Place the body of the function at the indicated exception vector address. See Chapter 3. “Interrupts” and Section 3.5 “Exception Handlers”.
naked
Generate no prologue or epilogue code for the function.
section ("name")
Place the function into the named section.
For example,
void __attribute__ ((section (".wilma"))) baz () {return;}
Function baz will be placed in section .wilma.
The -ffunction-sections command line option has no effect on functions defined with a section attribute.
unique_section
Place the function in a uniquely named section, just as if -ffunction-sections had been specified. If the function also has a section attribute, use that section name as the prefix for generating the unique section name.
For example,
void __attribute__ ((section (".fred"), unique_section) foo (void) {return;}
Function foo will be placed in section .fred.foo.
noreturn
Indicate to the compiler that the function will never return. In some situations, this can allow the compiler to generate more efficient code in the calling function since optimizations can be performed without regard to behavior if the function ever did return. Functions declared as noreturn should always have a return type of void.
noinline
The function will never be considered for inlining.
pure
If a function has no side effects other than its return value, and the return value is dependent only on parameters and/or (nonvolatile) global variables, the compiler can perform more aggressive optimizations around invocations of that function. Such functions can be indicated with the pure attribute.
const
If a pure function determines its return value exclusively from its parameters (i.e., does not examine any global variables), it may be declared const, allowing for even more aggressive optimization. Note that a function which de-references a pointer argument is not const since the pointer de-reference uses a value which is not an parameter, even though the pointer itself is a parameter.
format (type, format_index, first_to_check)
The format attribute indicates that the function takes a printf, scanf, strftime, or strftime mon style format string and arguments and that the compiler should type check those arguments against the format string, just as it does for the standard library functions.
The type parameter is one of printf, scanf, strftime or strftime mon (optionally with surrounding double underscores, e.g., __printf__) and determines how the format string will be interpreted.
The format_index parameter specifies which function parameter is the format string. Function parameters are numbered from the left-most parameter, starting from 1.
The `first_to_check` parameter specifies which parameter is the first to check against the format string. If `first_to_check` is zero, type checking is not performed and the compiler only checks the format string for consistency (e.g., `vfprintf`).

**format_arg (index)**

The `format_arg` attribute specifies that a function manipulates a `printf` style format string and that the compiler should check the format string for consistency. The function attribute which is a format string is identified by `index`.

**nonnull (index, ...)**

Indicate to the compiler that one or more pointer arguments to the function must be non-null. If the compiler determines that a null pointer is passed as a value to a non-null argument, and the `-Wnonnull` command line option was specified, a warning diagnostic is issued.

If no arguments are give to the `nonnull` attribute, all pointer arguments of the function are marked as non-null.

**unused**

Indicate to the compiler that the function may not be used. The compiler will not issue a warning for this function if it is not used.

**used**

Indicate to the compiler that the function is always used and code must be generated for the function even if the compiler cannot see a reference to the function. For example, if inline assembly is the only reference to a static function.

**deprecated**

When a function specified as `deprecated` is used, a warning is generated.

**warn_unused_result**

A warning will be issued if the return value of the indicated function is unused by a caller.

**weak**

A weak symbol indicates that if another version of the same symbol is available, that version should be used instead. For example, this is useful when a library function is implemented such that it can be overridden by a user written function.

**malloc**

Any non-null pointer return value from the indicated function will not alias any other pointer which is live at the point when the function returns. This allows the compiler to improve optimization.

**alias ("symbol")**

Indicates that the function is an alias for another symbol. For example,

```c
void foo (void) { /* stuff */ }
void bar (void) __attribute__((alias("foo")));
```

Symbol `bar` is considered to be an alias for symbol `foo`.

### 1.7.2 Variable Attributes

**aligned (n)**

The attributed variable will aligned on the next `n` byte boundary.

The `aligned` attribute can also be used on a structure member. Such a member will be aligned to the indicated boundary within the structure.

If the alignment value `n` is omitted, the alignment of the variable is set 8 (the largest alignment value for a basic data type).
Note that the `aligned` attribute is used to increase the alignment of a variable, not reduce it. To decrease the alignment value of a variable, use the `packed` attribute.

**cleanup (function)**
Indicate a function to call when the attributed automatic function scope variable goes out of scope.

The indicated function should take a single parameter, a pointer to a type compatible with the attributed variable, and have `void` return type.

**deprecated**
When a variable specified as `deprecated` is used, a warning is generated.

**packed**
The attributed variable or structure member will have the smallest possible alignment. That is, no alignment padding storage will be allocated for the declaration. Used in combination with the `aligned` attribute, `packed` can be used to set an arbitrary alignment restriction, greater or lesser than the default alignment for the type of the variable or structure member.

**section ("name")**
Place the function into the named section.

For example,

```c
unsigned int dan __attribute__((section(".quixote")))
```

Variable `dan` will be placed in section `.quixote`.

The `-fdata-sections` command line option has no effect on variables defined with a `section` attribute unless `unique_section` is also specified.

**unique_section**
Place the variable in a uniquely named section, just as if `-fdata-sections` had been specified. If the variable also has a `section` attribute, use that section name as the prefix for generating the unique section name.

For example,

```c
int tin __attribute__((section(".ofcatfood"), unique_section))
```

Variable `tin` will be placed in section `.ofcatfood`.

**transparent_union**
When a function parameter of union type has the `transparent_union` attribute attached, corresponding arguments are passed as if the type were the type of the first member of the union.

**unused**
Indicate to the compiler that the variable may not be used. The compiler will not issue a warning for this variable if it is not used.

**weak**
A weak symbol indicates that if another version of the same symbol is available, that version should be used instead.

### 1.7.3 Pragmas

**#pragma interrupt**
Mark a function as an interrupt handler. The prologue and epilogue code for the function will perform more extensive context preservation. See Chapter 3. “Interrupts” and Section 3.5 “Exception Handlers”.

**#pragma vector**
Generate a branch instruction at the indicated exception vector which targets the function. See Chapter 3. “Interrupts” and Section 3.5 “Exception Handlers”.

#pragma config

The #pragma config directive specifies the processor-specific configuration settings (i.e., configuration bits) to be used by the application. See Chapter 4. “Low Level Processor Control”.

1.8 COMMAND LINE OPTIONS

MPLAB C32 C compiler has many options for controlling compilation, all of which are case sensitive.

- Options Specific to PIC32MX Devices
- Options for Controlling the Kind of Output
- Options for Controlling the C Dialect
- Options for Controlling Warnings and Errors
- Options for Debugging
- Options for Controlling Optimization
- Options for Controlling the Preprocessor
- Options for Assembling
- Options for Linking
- Options for Directory Search
- Options for Code Generation Conventions

1.8.1 Options Specific to PIC32MX Devices

TABLE 1-2: PIC32MX DEVICE-SPECIFIC OPTIONS

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-mprocessor</td>
<td>Selects the device for which to compile (e.g., -mprocessor=32MX360F512L)</td>
</tr>
<tr>
<td>-mips16</td>
<td>Generate (do not generate) MIPS16 code.</td>
</tr>
<tr>
<td>-mno-mips16</td>
<td>Don't use floating-point libraries.</td>
</tr>
<tr>
<td>-mno-float</td>
<td>Assume that the floating-point coprocessor only supports single-precision operations.</td>
</tr>
<tr>
<td>-msingle-float</td>
<td>Assume that the floating-point coprocessor supports double-precision operations. This is the default.</td>
</tr>
<tr>
<td>-mdouble-float</td>
<td></td>
</tr>
<tr>
<td>-mlong64</td>
<td>Force long types to be 64 bits wide. See -mlong32 for an explanation of the default and the way that the pointer size is determined.</td>
</tr>
<tr>
<td>-mlong32</td>
<td>Force long, int, and pointer types to be 32 bits wide. The default size of int, longs and pointers is 32 bits.</td>
</tr>
<tr>
<td>-G num</td>
<td>Put global and static items less than or equal to num bytes into the small data or bss section instead of the normal data or bss section. This allows the data to be accessed using a single instruction. All modules should be compiled with the same -G num value.</td>
</tr>
</tbody>
</table>
Allocate variables to the read-only data section first if possible, then next in the small data section if possible, otherwise in data. This gives slightly slower code than the default, but reduces the amount of RAM required when executing, and thus may be preferred for some embedded systems.

Put uninitialized const variables in the read-only data section. This option is only meaningful in conjunction with -membedded-data.

Trap (do not trap) on integer division by zero. The default is -mcheck-zero-division.

Force (do not force) the use of memcpy() for non-trivial block moves. The default is -mno-memcpy, which allows GCC to inline most constant-sized copies.

Disable (do not disable) use of the jal instruction. Calling functions using jal is more efficient but requires the caller and callee to be in the same 256 megabyte segment. This option has no effect on abicalls code. The default is -mno-long-calls.

Do not use the standard peripheral libraries when linking.
### 1.8.2 Options for Controlling the Kind of Output

The following options control the kind of output produced by the compiler.

#### TABLE 1-3: KIND-OF-OUTPUT CONTROL OPTIONS

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-c</code></td>
<td>Compile or assemble the source files, but do not link. The default file extension is <code>.o</code>.</td>
</tr>
<tr>
<td><code>-E</code></td>
<td>Stop after the preprocessing stage, i.e., before running the compiler proper. The default output file is <code>stdout</code>.</td>
</tr>
<tr>
<td><code>-o file</code></td>
<td>Place the output in <code>file</code>.</td>
</tr>
<tr>
<td><code>-S</code></td>
<td>Stop after compilation proper (i.e., before invoking the assembler). The default output file extension is <code>.s</code>.</td>
</tr>
<tr>
<td><code>-v</code></td>
<td>Print the commands executed during each stage of compilation.</td>
</tr>
<tr>
<td><code>-x</code></td>
<td>You can specify the input language explicitly with the <code>-x</code> option: <code>-x_language</code> Specify explicitly the language for the following input files (rather than letting the compiler choose a default based on the file name suffix). This option applies to all following input files until the next <code>-x</code> option. The following values are supported by MPLAB C32 C compiler: <code>c</code> <code>c-header</code> <code>cpp-output</code> <code>assembler</code> <code>assembler-with-cpp</code> <code>&lt;x&gt; none</code> Turn off any specification of a language, so that subsequent files are handled according to their file name suffixes. This is the default behavior but is needed if another <code>-x</code> option has been used. For example: <code>pic32-gcc -x assembler foo.asm bar.asm -x none main.c mabonga.s</code> Without the <code>-x none</code>, the compiler assumes all the input files are for the assembler.</td>
</tr>
<tr>
<td><code>--help</code></td>
<td>Print a description of the command line options.</td>
</tr>
</tbody>
</table>
### 1.8.3 Options for Controlling the C Dialect

The following options define the kind of C dialect used by the compiler.

#### TABLE 1-4: C DIALECT CONTROL OPTIONS

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-ansi</code></td>
<td>Support all (and only) ANSI-standard C programs.</td>
<td></td>
</tr>
<tr>
<td><code>-aux-info filename</code></td>
<td>Output to the given filename prototyped declarations for all functions declared and/or defined in a translation unit, including those in header files. This option is silently ignored in any language other than C. Besides declarations, the file indicates, in comments, the origin of each declaration (source file and line), whether the declaration was implicit, prototyped or unprototyped (I, N for new or O for old, respectively, in the first character after the line number and the colon), and whether it came from a declaration or a definition (C or F, respectively, in the following character). In the case of function definitions, a K&amp;R-style list of arguments followed by their declarations is also provided, inside comments, after the declaration.</td>
<td></td>
</tr>
<tr>
<td><code>-ffreestanding</code></td>
<td>Assert that compilation takes place in a freestanding environment. This implies <code>-fno-builtin</code>. A freestanding environment is one in which the standard library may not exist, and program startup may not necessarily be at main. The most obvious example is an OS kernel. This is equivalent to <code>-fno-hosted</code>.</td>
<td></td>
</tr>
<tr>
<td><code>-fno-asm</code></td>
<td>Do not recognize <code>asm</code>, <code>inline</code> or <code>typeof</code> as a keyword, so that code can use these words as identifiers. You can use the keywords <code>__asm__</code>, <code>__inline__</code> and <code>__typeof__</code> instead. <code>-ansi</code> implies <code>-fno-asm</code>.</td>
<td></td>
</tr>
<tr>
<td><code>-fno-builtin</code></td>
<td>Don't recognize built-in functions that do not begin with <code>__builtin_</code> as prefix.</td>
<td></td>
</tr>
<tr>
<td><code>-fno-builtin-function</code></td>
<td>Let the type <code>char</code> be signed, like <code>signed char</code>. (This is the default.)</td>
<td></td>
</tr>
<tr>
<td><code>-fsigned-char</code></td>
<td>These options control whether a bit field is signed or unsigned, when the declaration does not use either signed or unsigned. By default, such a bit field is signed, unless <code>-traditional</code> is used, in which case bit fields are always unsigned.</td>
<td></td>
</tr>
<tr>
<td><code>-funsIGNED-bitfields</code></td>
<td>Let the type <code>char</code> be unsigned, like <code>unsigned char</code>.</td>
<td></td>
</tr>
<tr>
<td><code>-fwritable-strings</code></td>
<td>Store strings in the writable data segment and don't make them unique.</td>
<td></td>
</tr>
</tbody>
</table>
1.8.4 Options for Controlling Warnings and Errors

Warnings are diagnostic messages that report constructions that are not inherently erroneous but that are risky or suggest there may have been an error.

You can request many specific warnings with options beginning -W, for example, -Wimplicit, to request warnings on implicit declarations. Each of these specific warning options also has a negative form beginning -Wno- to turn off warnings, for example, -Wno-implicit. This manual lists only one of the two forms, whichever is not the default.

The following options control the amount and kinds of warnings produced by the MPLAB C32 C Compiler.

### TABLE 1-5: WARNING AND ERROR OPTIONS IMPLIED BY -WALL

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fsyntax-only</td>
<td>Check the code for syntax, but don’t do anything beyond that.</td>
</tr>
<tr>
<td>-pedantic</td>
<td>Issue all the warnings demanded by strict ANSI C. Reject all programs that use forbidden extensions.</td>
</tr>
<tr>
<td>-pedantic-errors</td>
<td>Like -pedantic, except that errors are produced rather than warnings.</td>
</tr>
<tr>
<td>-w</td>
<td>Inhibit all warning messages.</td>
</tr>
<tr>
<td>-Wall</td>
<td>All of the -W options listed in this table combined. This enables all the warnings about constructions that some users consider questionable, and that are easy to avoid (or modify to prevent the warning), even in conjunction with macros.</td>
</tr>
<tr>
<td>-Wchar-subscripts</td>
<td>Warn if an array subscript has type char.</td>
</tr>
<tr>
<td>-Wcomment</td>
<td>Warn whenever a comment-start sequence <em>/ appears in a /</em> comment, or whenever a Backslash-Newline appears in a // comment.</td>
</tr>
<tr>
<td>-Wdiv-by-zero</td>
<td>Warn about compile-time integer division by zero. To inhibit the warning messages, use -Wno-div-by-zero. Floating-point division by zero is not warned about, as it can be a legitimate way of obtaining infinities and NaNs. <strong>(This is the default.)</strong></td>
</tr>
<tr>
<td>-Werror-implicit-function-declaration</td>
<td>Give an error whenever a function is used before being declared.</td>
</tr>
<tr>
<td>-Wformat</td>
<td>Check calls to printf and scanf, etc., to make sure that the arguments supplied have types appropriate to the format string specified.</td>
</tr>
<tr>
<td>-Wimplicit</td>
<td>Equivalent to specifying both -Wimplicit-int and -Wimplicit-function-declaration.</td>
</tr>
<tr>
<td>-Wimplicit-function-declaration</td>
<td>Give a warning whenever a function is used before being declared.</td>
</tr>
<tr>
<td>-Wimplicit-int</td>
<td>Warn when a declaration does not specify a type.</td>
</tr>
<tr>
<td>-Wmain</td>
<td>Warn if the type of main is suspicious. main should be a function with external linkage, returning int, taking either zero, two or three arguments of appropriate types.</td>
</tr>
<tr>
<td>-Wmissing-braces</td>
<td>Warn if an aggregate or union initializer is not fully bracketed. In the following example, the initializer for a is not fully bracketed, but that for b is fully bracketed.</td>
</tr>
</tbody>
</table>

```c
int a[2][2] = { 0, 1, 2, 3 };
int b[2][2] = { { 0, 1 }, { 2, 3 } };
```
### TABLE 1-5: WARNING AND ERROR OPTIONS IMPLIED BY -WALL (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Wmultichar</td>
<td>Warn if a multi-character character constant is used. Usually, such constants are typographical errors. Since they have implementation-defined values, they should not be used in portable code. The following example illustrates the use of a multi-character character constant: char xx(void) { return('xx'); }</td>
</tr>
<tr>
<td>-Wno-multichar</td>
<td>No warnings for multi-character character constants.</td>
</tr>
<tr>
<td>-Wparentheses</td>
<td>Warn if parentheses are omitted in certain contexts, such as when there is an assignment in a context where a truth value is expected, or when operators are nested whose precedence people often find confusing.</td>
</tr>
<tr>
<td>-Wreturn-type</td>
<td>Warn whenever a function is defined with a return-type that defaults to int. Also warn about any return statement with no return-value in a function whose return-type is not void.</td>
</tr>
<tr>
<td>-Wsequence-point</td>
<td>Warn about code that may have undefined semantics because of violations of sequence point rules in the C standard. The C standard defines the order in which expressions in a C program are evaluated in terms of sequence points, which represent a partial ordering between the execution of parts of the program: those executed before the sequence point and those executed after it. These occur after the evaluation of a full expression (one which is not part of a larger expression), after the evaluation of the first operand of a &amp;&amp;,</td>
</tr>
</tbody>
</table>
### Language Specifics

#### TABLE 1-5: WARNING AND ERROR OPTIONS IMPLIED BY -WALL (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Wswitch</td>
<td>Warn whenever a switch statement has an index of enumeral type and lacks a case for one or more of the named codes of that enumeration. (The presence of a default label prevents this warning.) Case labels outside the enumeration range also provoke warnings when this option is used.</td>
</tr>
<tr>
<td>-Wsystem-headers</td>
<td>Print warning messages for constructs found in system header files. Warnings from system headers are normally suppressed, on the assumption that they usually do not indicate real problems and would only make the compiler output harder to read. Using this command line option tells MPLAB C32 C compiler to emit warnings from system headers as if they occurred in user code. However, note that using -Wall in conjunction with this option does not warn about unknown pragmas in system headers. For that, -Wunknown-pragmas must also be used.</td>
</tr>
<tr>
<td>-Wtrigraphs</td>
<td>Warn if any trigraphs are encountered (assuming they are enabled).</td>
</tr>
<tr>
<td>-Wuninitialized</td>
<td>Warn if an automatic variable is used without first being initialized. These warnings are possible only when optimization is enabled, because they require data flow information that is computed only when optimizing. These warnings occur only for variables that are candidates for register allocation. Therefore, they do not occur for a variable that is declared volatile, or whose address is taken, or whose size is other than 1, 2, 4 or 8 bytes. Also, they do not occur for structures, unions or arrays, even when they are in registers. Note that there may be no warning about a variable that is used only to compute a value that itself is never used, because such computations may be deleted by data flow analysis before the warnings are printed.</td>
</tr>
<tr>
<td>-Wunknown-pragmas</td>
<td>Warn when a #pragma directive is encountered which is not understood by MPLAB C32 C compiler. If this command line option is used, warnings are even be issued for unknown pragmas in system header files. This is not the case if the warnings were only enabled by the -Wall command line option.</td>
</tr>
<tr>
<td>-Wunused</td>
<td>Warn whenever a variable is unused aside from its declaration, whenever a function is declared static but never defined, whenever a label is declared but not used, and whenever a statement computes a result that is explicitly not used. In order to get a warning about an unused function parameter, both -W and -Wunused must be specified. Casting an expression to void suppresses this warning for an expression. Similarly, the unused attribute suppresses this warning for unused variables, parameters and labels.</td>
</tr>
<tr>
<td>-Wunused-function</td>
<td>Warn whenever a static function is declared but not defined or a non-inline static function is unused.</td>
</tr>
<tr>
<td>-Wunused-label</td>
<td>Warn whenever a label is declared but not used. To suppress this warning, use the unused attribute.</td>
</tr>
</tbody>
</table>
### TABLE 1-5: WARNING AND ERROR OPTIONS IMPLIED BY -WALL (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Wunused-parameter</td>
<td>Warn whenever a function parameter is unused aside from its declaration. To suppress this warning, use the <code>unused</code> attribute.</td>
</tr>
<tr>
<td>-Wunused-variable</td>
<td>Warn whenever a local variable or non-constant static variable is unused aside from its declaration. To suppress this warning, use the <code>unused</code> attribute.</td>
</tr>
<tr>
<td>-Wunused-value</td>
<td>Warn whenever a statement computes a result that is explicitly not used. To suppress this warning, cast the expression to <code>void</code>.</td>
</tr>
</tbody>
</table>
The following -W options are not implied by -Wall. Some of them warn about constructions that users generally do not consider questionable, but which you might occasionally wish to check for. Others warn about constructions that are necessary or hard to avoid in some cases, and there is no simple way to modify the code to suppress the warning.

### TABLE 1-6: WARNING AND ERROR OPTIONS NOT IMPLIED BY -WALL

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-W</td>
<td>Print extra warning messages for these events:</td>
</tr>
<tr>
<td></td>
<td>• A nonvolatile automatic variable might be changed by a call to <code>longjmp</code>. These warnings are possible only in optimizing compilation. The compiler sees only the calls to <code>setjmp</code>. It cannot know where <code>longjmp</code> will be called. In fact, a signal handler could call it at any point in the code. As a result, a warning may be generated even when there is in fact no problem, because <code>longjmp</code> cannot in fact be called at the place that would cause a problem.</td>
</tr>
<tr>
<td></td>
<td>• A function could exit both via <code>return value;</code> and <code>return;</code>. Completing the function body without passing any return statement is treated as <code>return;</code>.</td>
</tr>
<tr>
<td></td>
<td>• An expression-statement or the left-hand side of a comma expression contains no side effects. To suppress the warning, cast the unused expression to <code>void</code>. For example, an expression such as <code>x[i,j]</code> causes a warning, but <code>x[(void)i,j]</code> does not.</td>
</tr>
<tr>
<td></td>
<td>• An unsigned value is compared against zero with <code>&lt;</code> or <code>&lt;=</code>.</td>
</tr>
<tr>
<td></td>
<td>• A comparison like <code>x&lt;=y&lt;=z</code> appears. This is equivalent to <code>(x&lt;=y ? 1 : 0) &lt;= z</code>, which is a different interpretation from that of ordinary mathematical notation.</td>
</tr>
<tr>
<td></td>
<td>• Storage-class specifiers like <code>static</code> are not the first things in a declaration. According to the C Standard, this usage is obsolescent.</td>
</tr>
<tr>
<td></td>
<td>• If -Wall or -Wunused is also specified, warn about unused arguments.</td>
</tr>
<tr>
<td></td>
<td>• A comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned. (But don’t warn if -Wno-sign-compare is also specified.)</td>
</tr>
<tr>
<td></td>
<td>• An aggregate has a partly bracketed initializer. For example, the following code would evoke such a warning, because braces are missing around the initializer for <code>x.h</code>:</td>
</tr>
<tr>
<td></td>
<td>struct s { int f, g; };</td>
</tr>
<tr>
<td></td>
<td>struct t { struct s h; int i; };</td>
</tr>
<tr>
<td></td>
<td>struct t x = { 1, 2, 3 };</td>
</tr>
<tr>
<td></td>
<td>• An aggregate has an initializer that does not initialize all members. For example, the following code would cause such a warning, because <code>x.h</code> would be implicitly initialized to zero:</td>
</tr>
<tr>
<td></td>
<td>struct s { int f, g, h; };</td>
</tr>
<tr>
<td></td>
<td>struct s x = { 3, 4 };</td>
</tr>
<tr>
<td>-Waggregate-return</td>
<td>Warn if any functions that return structures or unions are defined or called.</td>
</tr>
<tr>
<td>-Wbad-function-cast</td>
<td>Warn whenever a function call is cast to a non-matching type. For example, warn if <code>int fooof()</code> is cast to anything *.</td>
</tr>
</tbody>
</table>
### TABLE 1-6: WARNING AND ERROR OPTIONS NOT IMPLIED BY -WALL (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-Wcast-align</code></td>
<td>Warn whenever a pointer is cast, such that the required alignment of the target is increased. For example, warn if a char * is cast to an int *.</td>
</tr>
<tr>
<td><code>-Wcast-qual</code></td>
<td>Warn whenever a pointer is cast, so as to remove a type qualifier from the target type. For example, warn if a const char * is cast to an ordinary char *.</td>
</tr>
<tr>
<td><code>-Wconversion</code></td>
<td>Warn if a prototype causes a type conversion that is different from what would happen to the same argument in the absence of a prototype. This includes conversions of fixed point to floating and vice versa, and conversions changing the width or signedness of a fixed point argument, except when the same as the default promotion. Also, warn if a negative integer constant expression is implicitly converted to an unsigned type. For example, warn about the assignment x = -1 if x is unsigned. But do not warn about explicit casts like (unsigned) -1.</td>
</tr>
<tr>
<td><code>-Werror</code></td>
<td>Make all warnings into errors.</td>
</tr>
<tr>
<td><code>-Winline</code></td>
<td>Warn if a function can not be inlined, and either it was declared as inline, or else the -finline-functions option was given.</td>
</tr>
<tr>
<td><code>-Wlarger-than-len</code></td>
<td>Warn whenever an object of larger than len bytes is defined.</td>
</tr>
<tr>
<td><code>-Wlong-long</code></td>
<td>Warn if long long type is used. This is default. To inhibit the warning messages, use -Wno-long-long. Flags -Wlong-long and -Wno-long-long are taken into account only when -pedantic flag is used.</td>
</tr>
<tr>
<td><code>-Wmissing-declarations</code></td>
<td>Warn if a global function is defined without a previous declaration. Do so even if the definition itself provides a prototype.</td>
</tr>
<tr>
<td><code>-Wmissing-format-attribute</code></td>
<td>If -Wformat is enabled, also warn about functions that might be candidates for format attributes. Note these are only possible candidates, not absolute ones. This option has no effect unless -Wformat is enabled.</td>
</tr>
<tr>
<td><code>-Wmissing-noreturn</code></td>
<td>Warn about functions that might be candidates for attribute noreturn. These are only possible candidates, not absolute ones. Care should be taken to manually verify functions. Actually, do not ever return before adding the noreturn attribute, otherwise subtle code generation bugs could be introduced.</td>
</tr>
<tr>
<td><code>-Wmissing-prototypes</code></td>
<td>Warn if a global function is defined without a previous prototype declaration. This warning is issued even if the definition itself provides a prototype. (This option can be used to detect global functions that are not declared in header files.)</td>
</tr>
<tr>
<td><code>-Wnested-externs</code></td>
<td>Warn if an extern declaration is encountered within a function.</td>
</tr>
<tr>
<td><code>-Wno-deprecated-declarations</code></td>
<td>Do not warn about uses of functions, variables and types marked as deprecated by using the deprecated attribute.</td>
</tr>
<tr>
<td><code>-Wpadded</code></td>
<td>Warn if padding is included in a structure, either to align an element of the structure or to align the whole structure.</td>
</tr>
<tr>
<td><code>-Wpointer-arith</code></td>
<td>Warn about anything that depends on the size of a function type or of void. MPLAB C32 C compiler assigns these types a size of 1, for convenience in calculations with void * pointers and pointers to functions.</td>
</tr>
</tbody>
</table>
## TABLE 1-6: WARNING AND ERROR OPTIONS NOT IMPLIED BY -WALL (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Wredundant-decls</td>
<td>Warn if anything is declared more than once in the same scope, even in cases where multiple declaration is valid and changes nothing.</td>
</tr>
<tr>
<td>-Wshadow</td>
<td>Warn whenever a local variable shadows another local variable.</td>
</tr>
<tr>
<td>-Wsign-compare</td>
<td>Warn when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned. This warning is also enabled by -W. To get the other warnings of -W without this warning, use -W -Wno-sign-compare.</td>
</tr>
<tr>
<td>-Wstrict-prototypes</td>
<td>Warn if a function is declared or defined without specifying the argument types. (An old-style function definition is permitted without a warning if preceded by a declaration which specifies the argument types.)</td>
</tr>
<tr>
<td>-Wtraditional</td>
<td>Warn about certain constructs that behave differently in traditional and ANSI C.</td>
</tr>
<tr>
<td></td>
<td>• Macro arguments occurring within string constants in the macro body. These would substitute the argument in traditional C, but are part of the constant in ANSI C.</td>
</tr>
<tr>
<td></td>
<td>• A function declared external in one block and then used after the end of the block.</td>
</tr>
<tr>
<td></td>
<td>• A switch statement has an operand of type long.</td>
</tr>
<tr>
<td></td>
<td>• A nonstatic function declaration follows a static one. This construct is not accepted by some traditional C compilers.</td>
</tr>
<tr>
<td>-Wundef</td>
<td>Warn if an undefined identifier is evaluated in an #if directive.</td>
</tr>
<tr>
<td>-Wunreachable-code</td>
<td>Warn if the compiler detects that code will never be executed. It is possible for this option to produce a warning even though there are circumstances under which part of the affected line can be executed, so care should be taken when removing apparently-unreachable code. For instance, when a function is inlined, a warning may mean that the line is unreachable in only one inlined copy of the function.</td>
</tr>
<tr>
<td>-Wwrite-strings</td>
<td>Give string constants the type const char[length] so that copying the address of one into a non-const char * pointer gets a warning. At compile time, these warnings help you find code that you can try to write into a string constant, but only if you have been very careful about using const in declarations and prototypes. Otherwise, it’s just a nuisance, which is why -Wall does not request these warnings.</td>
</tr>
</tbody>
</table>
1.8.5 Options for Debugging

The following options are used for debugging.

**TABLE 1-7: DEBUGGING OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
</table>
| `-g`        | Produce debugging information. MPLAB C32 C compiler supports the use of `-g` with `-O` making it possible to debug optimized code. The shortcuts taken by optimized code may occasionally produce surprising results:  
• Some declared variables may not exist at all;  
• Flow of control may briefly move unexpectedly;  
• Some statements may not be executed because they compute constant results or their values were already at hand;  
• Some statements may execute in different places because they were moved out of loops. Nevertheless it proves possible to debug optimized output. This makes it reasonable to use the optimizer for programs that might have bugs. |
| `-Q`        | Makes the compiler print out each function name as it is compiled, and print some statistics about each pass when it finishes. |
| `-save-temps` | Don’t delete intermediate files. Place them in the current directory and name them based on the source file. Thus, compiling `foo.c` with `-c` `-save-temps` would produce the following files:  
  `foo.i` (preprocessed file)  
  `foo.s` (assembly language file)  
  `foo.o` (object file) |
1.8.6 Options for Controlling Optimization

The following options control compiler optimizations.

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-O0</td>
<td>Do not optimize. <em>(This is the default.)</em></td>
</tr>
<tr>
<td></td>
<td>Without -O, the compiler’s goal is to reduce the cost of compilation and to make debugging</td>
</tr>
<tr>
<td></td>
<td>produce the expected results. Statements are independent: if you stop the program</td>
</tr>
<tr>
<td></td>
<td>with a breakpoint between statements, you can then assign a new value to any variable or</td>
</tr>
<tr>
<td></td>
<td>change the program counter to any other statement in the function and get exactly the results</td>
</tr>
<tr>
<td></td>
<td>you would expect from the source code. The compiler only allocates variables declared</td>
</tr>
<tr>
<td></td>
<td>register in registers.</td>
</tr>
<tr>
<td>-O</td>
<td>Optimization level 1. Optimizing compilation takes somewhat longer, and a lot more host</td>
</tr>
<tr>
<td>-O1</td>
<td>memory for a large function. With -O, the compiler tries to reduce code size and execution</td>
</tr>
<tr>
<td></td>
<td>time. When -O is specified, the compiler turns on -fthread-jumps and -fdefer-pop. The</td>
</tr>
<tr>
<td></td>
<td>compiler turns on -fomit-frame-pointer.</td>
</tr>
<tr>
<td>-O2</td>
<td>Optimization level 2. MPLAB C32 C compiler performs nearly all supported optimizations that</td>
</tr>
<tr>
<td></td>
<td>do not involve a space-speed trade-off. -O2 turns on all optional optimizations except for</td>
</tr>
<tr>
<td></td>
<td>loop unrolling (-funroll-loops), function inlining (-finline-functions), and strict aliasing</td>
</tr>
<tr>
<td></td>
<td>optimizations (-fstrict-aliasing). It also turns on force copy of memory operands (-fforce-mem)</td>
</tr>
<tr>
<td></td>
<td>and Frame Pointer elimination (-fomit-frame-pointer). As compared to -O, this option</td>
</tr>
<tr>
<td></td>
<td>increases both compilation time and the performance of the generated code.</td>
</tr>
<tr>
<td>-O3</td>
<td>Optimization level 3. -O3 turns on all optimizations specified by -O2 and also turns on the</td>
</tr>
<tr>
<td></td>
<td>inline-functions option.</td>
</tr>
<tr>
<td>-Os</td>
<td>Optimize for size. -Os enables all -O2 optimizations that do not typically increase code size.</td>
</tr>
<tr>
<td></td>
<td>It also performs further optimizations designed to reduce code size.</td>
</tr>
</tbody>
</table>

The following options control specific optimizations. The -O2 option turns on all of these optimizations except -funroll-loops, -funroll-all-loops and -fstrict-aliasing.
You can use the following flags in the rare cases when “fine-tuning” of optimizations to be performed is desired.

**TABLE 1-9: SPECIFIC OPTIMIZATION OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-falign-functions</td>
<td>Align the start of functions to the next power-of-two greater than ( n ), skipping up to ( n ) bytes. For instance, -falign-functions=32 aligns functions to the next 32-byte boundary, but -falign-functions=24 would align to the next 32-byte boundary only if this can be done by skipping 23 bytes or less. -fno-align-functions and -falign-functions=1 are equivalent and mean that functions are not aligned. The assembler only supports this flag when ( n ) is a power of two, so ( n ) is rounded up. If ( n ) is not specified, use a machine-dependent default.</td>
</tr>
<tr>
<td>-falign-labels</td>
<td>Align all branch targets to a power-of-two boundary, skipping up to ( n ) bytes like -falign-functions. This option can easily make code slower, because it must insert dummy operations for when the branch target is reached in the usual flow of the code. If -falign-loops or -falign-jumps are applicable and are greater than this value, then their values are used instead. If ( n ) is not specified, use a machine-dependent default which is very likely to be 1, meaning no alignment.</td>
</tr>
<tr>
<td>-falign-loops</td>
<td>Align loops to a power-of-two boundary, skipping up to ( n ) bytes like -falign-functions. The hope is that the loop is executed many times, which makes up for any execution of the dummy operations. If ( n ) is not specified, use a machine-dependent default.</td>
</tr>
<tr>
<td>-fcaller-saves</td>
<td>Enable values to be allocated in registers that are clobbered by function calls, by emitting extra instructions to save and restore the registers around such calls. Such allocation is done only when it seems to result in better code than would otherwise be produced.</td>
</tr>
<tr>
<td>-fcse-follow-jumps</td>
<td>In common subexpression elimination, scan through jump instructions when the target of the jump is not reached by any other path. For example, when CSE encounters an if statement with an else clause, CSE follows the jump when the condition tested is false.</td>
</tr>
<tr>
<td>-fcse-skip-blocks</td>
<td>This is similar to -fcse-follow-jumps, but causes CSE to follow jumps which conditionally skip over blocks. When CSE encounters a simple if statement with no else clause, -fcse-skip-blocks causes CSE to follow the jump around the body of the if.</td>
</tr>
<tr>
<td>-fexpensive-optimizations</td>
<td>Perform a number of minor optimizations that are relatively expensive.</td>
</tr>
<tr>
<td>-ffunction-sections</td>
<td>Place each function or data item into its own section in the output file. The name of the function or the name of the data item determines the section's name in the output file. Only use these options when there are significant benefits for doing so. When you specify these options, the assembler and linker may create larger object and executable files and is also slower.</td>
</tr>
<tr>
<td>-fgcse</td>
<td>Perform a global common subexpression elimination pass. This pass also performs global constant and copy propagation.</td>
</tr>
</tbody>
</table>
When `-fgcse-lm` is enabled, global common subexpression elimination attempts to move loads which are only killed by stores into themselves. This allows a loop containing a load/store sequence to change to a load outside the loop, and a copy/store within the loop.

When `-fgcse-sm` is enabled, a store motion pass is run after global common subexpression elimination. This pass attempts to move stores out of loops. When used in conjunction with `-fgcse-lm`, loops containing a load/store sequence can change to a load before the loop and a store after the loop.

 Forces all invariant computations in loops to be moved outside the loop.

Always pop the arguments to each function call as soon as that function returns. The compiler normally lets arguments accumulate on the stack for several function calls and pops them all at once.

Disable machine specific peephole optimizations. Peephole optimizations occur at various points during the compilation. `-fno-peephole` disables peephole optimization on machine instructions, while `-fno-peephole2` disables high level peephole optimizations. To disable peephole entirely, use both options.

Attempt to reassign register numbers in move instructions and as operands of other simple instructions in order to maximize the amount of register tying. `-fregmove` and `-foptimize-register-moves` are the same optimization.

Forces all general-induction variables in loops to be strength-reduced. These options may generate better or worse code. Results are highly dependent on the structure of loops within the source code.

Attempt to avoid false dependencies in scheduled code by making use of registers left over after register allocation. This optimization most benefits processors with lots of registers. It can, however, make debugging impossible, since variables no longer stay in a "home register".

Rerun common subexpression elimination after loop optimizations has been performed.

Run the loop optimizer twice.

Attempt to reorder instructions to eliminate instruction stalls due to required data being unavailable.

Similar to `-fschedule-insns`, but requests an additional pass of instruction scheduling after register allocation has been done.

Perform the optimizations of loop strength reduction and elimination of iteration variables.

<td>Attempt to reorder instructions to eliminate instruction stalls due to required data being unavailable.</td>
</tr>
<tr>
<td><code>-fschedule-insns2</code></td>
<td>Similar to <code>-fschedule-insns</code>, but requests an additional pass of instruction scheduling after register allocation has been done.</td>
</tr>
<tr>
<td><code>-fstrength-reduce</code></td>
<td>Perform the optimizations of loop strength reduction and elimination of iteration variables.</td>
</tr>
</tbody>
</table>
-fstrict-aliasing  Allows the compiler to assume the strictest aliasing rules applicable to the language being compiled. For C, this activates optimizations based on the type of expressions. In particular, an object of one type is assumed never to reside at the same address as an object of a different type, unless the types are almost the same. For example, an unsigned int can alias an int, but not a void* or a double. A character type may alias any other type.

Pay special attention to code like this:

```
union a_union {
  int i;
  double d;
};

int f() {
  union a_union t;
  t.d = 3.0;
  return t.i;
}
```

The practice of reading from a different union member than the one most recently written to (called “type-punning”) is common. Even with -fstrict-aliasing, type-punning is allowed, provided the memory is accessed through the union type. So, the code above works as expected. However, this code might not:

```
int f() {
  a_union t;
  int* ip;
  t.d = 3.0;
  ip = &t.i;
  return *ip;
}
```

-fthread-jumps  Perform optimizations where a check is made to see if a jump branches to a location where another comparison subsumed by the first is found. If so, the first branch is redirected to either the destination of the second branch or a point immediately following it, depending on whether the condition is known to be true or false.

-funroll-loops  Perform the optimization of loop unrolling. This is only done for loops whose number of iterations can be determined at compile time or runtime. -funroll-loops implies both -fstrength-reduce and -frerun-cse-after-loop.

-funroll-all-loops  Perform the optimization of loop unrolling. This is done for all loops and usually makes programs run more slowly. -funroll-all-loops implies -fstrength-reduce, as well as -frerun-cse-after-loop.
Options of the form `-fflag` specify machine-independent flags. Most flags have both positive and negative forms. The negative form of `-ffoo` would be `-fno-foo`. In the table below, only one of the forms is listed (the one that is not the default.)

**TABLE 1-10: MACHINE-INDEPENDENT OPTIMIZATION OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-fforce-mem</code></td>
<td>Force memory operands to be copied into registers before doing arithmetic on them. This produces better code by making all memory references potential common subexpressions. When they are not common subexpressions, instruction combination should eliminate the separate register-load. The <code>-O2</code> option turns on this option.</td>
</tr>
<tr>
<td><code>-finline-functions</code></td>
<td>Integrate all simple functions into their callers. The compiler heuristically decides which functions are simple enough to be worth integrating in this way. If all calls to a given function are integrated, and the function is declared <code>static</code>, then the function is normally not output as assembler code in its own right.</td>
</tr>
<tr>
<td><code>-finline-limit=n</code></td>
<td>By default, MPLAB C32 C compiler limits the size of functions that can be inlined. This flag allows the control of this limit for functions that are explicitly marked as inline (i.e., marked with the <code>inline</code> keyword). <code>n</code> is the size of functions that can be inlined in number of pseudo instructions (not counting parameter handling). The default value of <code>n</code> is 10000. Increasing this value can result in more inlined code at the cost of compilation time and memory consumption. Decreasing usually makes the compilation faster and less code is inlined (which presumably means slower programs). This option is particularly useful for programs that use inlining. <strong>Note:</strong> Pseudo instruction represents, in this particular context, an abstract measurement of function's size. In no way does it represent a count of assembly instructions and as such, its exact meaning might change from one release of the compiler to another.</td>
</tr>
<tr>
<td><code>-fkeep-inline-functions</code></td>
<td>Even if all calls to a given function are integrated, and the function is declared <code>static</code>, output a separate runtime callable version of the function. This switch does not affect <code>extern</code> inline functions.</td>
</tr>
<tr>
<td><code>-fkeep-static-consts</code></td>
<td>Emit variables declared static const when optimization isn't turned on, even if the variables are not referenced. MPLAB C32 C compiler enables this option by default. If you want to force the compiler to check if the variable was referenced, regardless of whether or not optimization is turned on, use the <code>-fno-keep-static-consts</code> option.</td>
</tr>
<tr>
<td><code>-fno-function-cse</code></td>
<td>Do not put function addresses in registers. Make each instruction that calls a constant function contain the function's address explicitly. This option results in less efficient code, but some strange hacks that alter the assembler output may be confused by the optimizations performed when this option is not used.</td>
</tr>
</tbody>
</table>
1.8.7 Options for Controlling the Preprocessor

The following options control the compiler preprocessor.

### TABLE 1-11: PREPROCESSOR OPTIONS

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-A question (answer)</td>
<td>Assert the answer answer for question question, in case it is tested with a preprocessing conditional such as #if #question(answer). -A- disables the standard assertions that normally describe the target machine. For example, the function prototype for main might be declared as follows: #if #environ(freestanding) int main(void); #else int main(int argc, char *argv[]); #endif A -A command line option could then be used to select between the two prototypes. For example, to select the first of the two, the following command line option could be used: -Aenviron(freestanding)</td>
</tr>
<tr>
<td>-A -predicate =answer</td>
<td>Cancel an assertion with the predicate predicate and answer answer.</td>
</tr>
<tr>
<td>-A predicate =answer</td>
<td>Make an assertion with the predicate predicate and answer answer. This form is preferred to the older form -A predicate(answer), which is still supported, because it does not use shell special characters.</td>
</tr>
<tr>
<td>-C</td>
<td>Tell the preprocessor not to discard comments. Used with the -E option.</td>
</tr>
<tr>
<td>-dD</td>
<td>Tell the preprocessor to not remove macro definitions into the output, in their proper sequence.</td>
</tr>
<tr>
<td>-Dmacro</td>
<td>Define macro macro with the string 1 as its definition.</td>
</tr>
<tr>
<td>-Dmacro=defn</td>
<td>Define macro macro as defn. All instances of -D on the command line are processed before any -U options.</td>
</tr>
<tr>
<td>-dM</td>
<td>Tell the preprocessor to output only a list of the macro definitions that are in effect at the end of preprocessing. Used with the -E option.</td>
</tr>
<tr>
<td>-dN</td>
<td>Like -dD except that the macro arguments and contents are omitted. Only #define name is included in the output.</td>
</tr>
<tr>
<td>-fno-show-column</td>
<td>Do not print column numbers in diagnostics. This may be necessary if diagnostics are being scanned by a program that does not understand the column numbers, such as dejagnu.</td>
</tr>
<tr>
<td>-H</td>
<td>Print the name of each header file used, in addition to other normal activities.</td>
</tr>
</tbody>
</table>
### TABLE 1-11: PREPROCESSOR OPTIONS (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-I-</code></td>
<td>Any directories you specify with <code>-I</code> options before the <code>-I-</code> options are searched only for the case of <code>#include &quot;file&quot;</code>. They are not searched for <code>#include &lt;file&gt;</code>. If additional directories are specified with <code>-I</code> options after the <code>-I-</code>, these directories are searched for all <code>#include</code> directives. (Ordinarily all <code>-I</code> directories are used this way.) In addition, the <code>-I-</code> option inhibits the use of the current directory (where the current input file came from) as the first search directory for <code>#include &quot;file&quot;</code>. There is no way to override this effect of <code>-I-</code>. With <code>-I-</code> you can specify searching the directory that was current when the compiler was invoked. That is not exactly the same as what the preprocessor does by default, but it is often satisfactory. <code>-I-</code> does not inhibit the use of the standard system directories for header files. Thus, <code>-I-</code> and <code>-nostdinc</code> are independent.</td>
</tr>
<tr>
<td><code>-Idir</code></td>
<td>Add the directory <code>dir</code> to the head of the list of directories to be searched for header files. This can be used to override a system header file, substituting your own version, since these directories are searched before the system header file directories. If you use more than one <code>-I</code> option, the directories are scanned in left-to-right order. The standard system directories come after.</td>
</tr>
<tr>
<td><code>-idirafter dir</code></td>
<td>Add the directory <code>dir</code> to the second include path. The directories on the second include path are searched when a header file is not found in any of the directories in the main include path (the one that <code>-I</code> adds to).</td>
</tr>
<tr>
<td><code>-imacros file</code></td>
<td>Process file as input, discarding the resulting output, before processing the regular input file. Because the output generated from the file is discarded, the only effect of <code>-imacros file</code> is to make the macros defined in file available for use in the main input. Any <code>-D</code> and <code>-U</code> options on the command line are always processed before <code>-imacros file</code>, regardless of the order in which they are written. All the <code>-include</code> and <code>-imacros</code> options are processed in the order in which they are written.</td>
</tr>
<tr>
<td><code>-include file</code></td>
<td>Process file as input before processing the regular input file. In effect, the contents of file are compiled first. Any <code>-D</code> and <code>-U</code> options on the command line are always processed before <code>-include file</code>, regardless of the order in which they are written. All the <code>-include</code> and <code>-imacros</code> options are processed in the order in which they are written.</td>
</tr>
<tr>
<td><code>-iprefix prefix</code></td>
<td>Specify <code>prefix</code> as the prefix for subsequent <code>-iwithprefix</code> options.</td>
</tr>
<tr>
<td><code>-isystem dir</code></td>
<td>Add a directory to the beginning of the second include path, marking it as a system directory, so that it gets the same special treatment as is applied to the standard system directories.</td>
</tr>
<tr>
<td><code>-iwithprefix dir</code></td>
<td>Add a directory to the second include path. The directory’s name is made by concatenating <code>prefix</code> and <code>dir</code>, where <code>prefix</code> was specified previously with <code>-iprefix</code>. If a prefix has not yet been specified, the directory containing the installed passes of the compiler is used as the default.</td>
</tr>
<tr>
<td><code>-iwithprefixbefore dir</code></td>
<td>Add a directory to the main include path. The directory’s name is made by concatenating <code>prefix</code> and <code>dir</code>, as in the case of <code>-iwithprefix</code>.</td>
</tr>
</tbody>
</table>
Tell the preprocessor to output a rule suitable for make describing the dependencies of each object file. For each source file, the preprocessor outputs one make-rule whose target is the object file name for that source file and whose dependencies are all the #include header files it uses. This rule may be a single line or may be continued with `-newline` if it is long. The list of rules is printed on standard output instead of the preprocessed C program.

- `M` implies `-E` (see Section 1.8.2 “Options for Controlling the Kind of Output”).

- `-MD` Like `-M` but the dependency information is written to a file and compilation continues. The file containing the dependency information is given the same name as the source file with a `.d` extension.

- `-MF file` When used with `-M` or `-MM`, specifies a file in which to write the dependencies. If no `-MF` switch is given, the preprocessor sends the rules to the same place it would have sent preprocessed output. When used with the driver options, `-MD` or `-MMD`, overrides the default dependency output file.

- `-MG` Treat missing header files as generated files and assume they live in the same directory as the source file. If `-MG` is specified, then either `-M` or `-MM` must also be specified. `-MG` is not supported with `-MD` or `-MMD`.

- `-MM` Like `-M` but the output mentions only the user header files included with `#include "file"`. System header files included with `#include <file>` are omitted.

- `-MMD` Like `-MD` except mention only user header files, not system header files.

- `-MP` This option instructs CPP to add a phony target for each dependency other than the main file, causing each to depend on nothing. These dummy rules work around errors make gives if you remove header files without updating the make-file to match. This is typical output:
  ```
  test.o: test.c test.h
  test.h: 
  ```

- `-MQ` Same as `-MT`; but it quotes any characters which are special to make.
  ```
  -MQ '${(objpfx)foo.o}' gives ${$(objpfx)foo.o: foo.c
  ```

- `-MQ` The default target is automatically quoted, as if it were given with `-MQ`.

- `-MT target` Change the target of the rule emitted by dependency generation. By default, CPP takes the name of the main input file, including any path, deletes any file suffix such as `.c`, and appends the platform’s usual object suffix. The result is the target.
  ```
  An `-MT` option sets the target to be exactly the string you specify. If you want multiple targets, you can specify them as a single argument to `-MT`; or use multiple `-MT` options.
  ```

For example:
  ```
  -MT '${(objpfx)foo.o}' might give ${$(objpfx)foo.o: foo.c
  ```

<table>
<thead>
<tr>

<td>Like <code>-M</code> but the output mentions only the user header files included with <code>#include &quot;file&quot;</code>. System header files included with <code>#include &lt;file&gt;</code> are omitted.</td>
</tr>
<tr>
<td><code>-MMD</code></td>
<td>Like <code>-MD</code> except mention only user header files, not system header files.</td>
</tr>
<tr>
<td><code>-MP</code></td>
<td>This option instructs CPP to add a phony target for each dependency other than the main file, causing each to depend on nothing. These dummy rules work around errors make gives if you remove header files without updating the make-file to match. This is typical output:</td>
</tr>
</tbody>
</table>
| `-MQ`  | Same as `-MT`; but it quotes any characters which are special to make. `-MQ '${(objpfx)foo.o}' gives ${$(objpfx)foo.o: foo.c
| `-MT target` | Change the target of the rule emitted by dependency generation. By default, CPP takes the name of the main input file, including any path, deletes any file suffix such as `.c`, and appends the platform’s usual object suffix. The result is the target. An `-MT` option sets the target to be exactly the string you specify. If you want multiple targets, you can specify them as a single argument to `-MT`; or use multiple `-MT` options. For example: ` `-MT '${(objpfx)foo.o}' might give ${$(objpfx)foo.o: foo.c

```
1.8.8  Options for Assembling

The following options control assembler operations.

**TABLE 1-12: ASSEMBLY OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Wa,option</td>
<td>Pass option as an option to the assembler. If option contains commas, it is split into multiple options at the commas.</td>
</tr>
</tbody>
</table>
1.8.9 Options for Linking

If any of the options -c, -S or -E are used, the linker is not run and object file names should not be used as arguments.

**TABLE 1-13: LINKING OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Ldir</td>
<td>Add directory dir to the list of directories to be searched for libraries specified by the command line option -l.</td>
</tr>
<tr>
<td>-llibrary</td>
<td>Search the library named library when linking.</td>
</tr>
<tr>
<td></td>
<td>The linker searches a standard list of directories for the library, which is actually a file named liblibrary.a. The linker then uses this file as if it had been specified precisely by name. It makes a difference where in the command you write this option. The linker processes libraries and object files in the order they are specified. Thus, foo.o -lz bar.o searches library z after file foo.o but before bar.o. If bar.o refers to functions in libz.a, those functions may not be loaded. The directories searched include several standard system directories, plus any that you specify with -L. Normally the files found this way are library files (archive files whose members are object files). The linker handles an archive file by scanning through it for members which define symbols that have so far been referenced but not defined. But if the file that is found is an ordinary object file, it is linked in the usual fashion. The only difference between using an -l option (e.g., -lmylib) and specifying a file name (e.g., libmylib.a) is that -l searches several directories, as specified. By default the linker is directed to search: &lt;install-path&gt;/lib for libraries specified with the -l option. For a compiler installed into the default location, this would be: c:\Program Files\Microchip\MPLAB C32\lib This behavior can be overridden using the environment variables.</td>
</tr>
<tr>
<td>-nodefaultlibs</td>
<td>Do not use the standard system libraries when linking. Only the libraries you specify are passed to the linker. The compiler may generate calls to memcmp, memset and memcpy. These entries are usually resolved by entries in the standard compiler libraries. These entry points should be supplied through some other mechanism when this option is specified.</td>
</tr>
<tr>
<td>-nostdlib</td>
<td>Do not use the standard system startup files or libraries when linking. No startup files and only the libraries you specify are passed to the linker. The compiler may generate calls to memcmp, memset and memcpy. These entries are usually resolved by entries in standard compiler libraries. These entry points should be supplied through some other mechanism when this option is specified.</td>
</tr>
<tr>
<td>-s</td>
<td>Remove all symbol table and relocation information from the executable.</td>
</tr>
<tr>
<td>-u symbol</td>
<td>Pretend symbol is undefined to force linking of library modules to define the symbol. It is legitimate to use -u multiple times with different symbols to force loading of additional library modules.</td>
</tr>
<tr>
<td>-Wl,option</td>
<td>Pass option as an option to the linker. If option contains commas, it is split into multiple options at the commas.</td>
</tr>
<tr>
<td>-Xlinker option</td>
<td>Pass option as an option to the linker. You can use this to supply system-specific linker options that MPLAB C32 C compiler does not know how to recognize.</td>
</tr>
</tbody>
</table>
1.8.10 Options for Directory Search

The following options specify to the compiler where to find directories and files to search.

**TABLE 1-14: DIRECTORY SEARCH OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Bprefix</td>
<td>This option specifies where to find the executables, libraries, include files and data files of the compiler itself. The compiler driver program runs one or more of the sub-programs pic32-cpp, pic32-cc1, pic32-as and pic32-ld. It tries prefix as a prefix for each program it tries to run. For each sub-program to be run, the compiler driver first tries the -B prefix, if any. Lastly, the driver searches the current PATH environment variable for the subprogram. -B prefixes that effectively specify directory names also apply to libraries in the linker, because the compiler translates these options into -L options for the linker. They also apply to include files in the preprocessor, because the compiler translates these options into -isystem options for the preprocessor. In this case, the compiler appends include to the prefix.</td>
</tr>
<tr>
<td>-specs=file</td>
<td>Process file after the compiler reads in the standard specs file, in order to override the defaults that the pic32-gcc driver program uses when determining what switches to pass to pic32-cc1, pic32-as, pic32-ld, etc. More than one -specs=file can be specified on the command line, and they are processed in order, from left to right.</td>
</tr>
</tbody>
</table>
1.8.11 Options for Code Generation Conventions

Options of the form `-fflag` specify machine-independent flags. Most flags have both positive and negative forms. The negative form of `-ffoo` would be `-fno-foo`. In the table below, only one of the forms is listed (the one that is not the default.)

**TABLE 1-15: CODE GENERATION CONVENTION OPTIONS**

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-fargument-alias</code></td>
<td>Specify the possible relationships among parameters and between parameters and global data.</td>
</tr>
<tr>
<td><code>-fargument-noalias</code></td>
<td>-fargument-alias specifies that arguments (parameters) may alias each other and may alias global storage.</td>
</tr>
<tr>
<td><code>-fargument-noalias-global</code></td>
<td>-fargument-noalias specifies that arguments do not alias each other, but may alias global storage.</td>
</tr>
<tr>
<td></td>
<td>-fargument-noalias-global specifies that arguments do not alias each other and do not alias global storage.</td>
</tr>
<tr>
<td></td>
<td>Each language automatically uses whatever option is required by the language standard. You should not need to use these options yourself.</td>
</tr>
<tr>
<td><code>-fcall-saved-reg</code></td>
<td>Treat the register named <code>reg</code> as an allocatable register saved by functions. It may be allocated even for temporaries or variables that live across a call. Functions compiled this way saves and restores the register <code>reg</code> if they use it. It is an error to used this flag with the Frame Pointer or Stack Pointer. Use of this flag for other registers that have fixed pervasive roles in the machine's execution model produces disastrous results. A different sort of disaster results from the use of this flag for a register in which function values are returned. This flag should be used consistently through all modules.</td>
</tr>
<tr>
<td><code>-fcall-used-reg</code></td>
<td>Treat the register named <code>reg</code> as an allocatable register that is clobbered by function calls. It may be allocated for temporaries or variables that do not live across a call. Functions compiled this way do not save and restore the register <code>reg</code>. It is an error to use this flag with the Frame Pointer or Stack Pointer. Use of this flag for other registers that have fixed pervasive roles in the machine's execution model produces disastrous results. This flag should be used consistently through all modules.</td>
</tr>
<tr>
<td><code>-ffixed-reg</code></td>
<td>Treat the register named <code>reg</code> as a fixed register. Generated code should never refer to it (except perhaps as a Stack Pointer, Frame Pointer or in some other fixed role). <code>reg</code> must be the name of a register, e.g., <code>-ffixed-$0</code>.</td>
</tr>
</tbody>
</table>
TABLE 1-15: CODE GENERATION CONVENTION OPTIONS (CONTINUED)

<table>
<thead>
<tr>
<th>Option</th>
<th>Definition</th>
</tr>
</thead>
</table>
| -finstrument-functions  | Generate instrumentation calls for entry and exit to functions. Just after function entry and just before function exit, the following profiling functions are called with the address of the current function and its call site.  
  void __cyg_profile_func_enter  
  (void *this_fn, void *call_site);  
  void __cyg_profile_func_exit  
  (void *this_fn, void *call_site);  
  The first argument is the address of the start of the current function, which may be looked up exactly in the symbol table.  
  The profiling functions should be provided by the user.  
  Function instrumentation requires the use of a Frame Pointer.  
  Some optimization levels disable the use of the Frame Pointer.  
  Using -fno-omit-frame-pointer prevents this.  
  This instrumentation is also done for functions expanded inline in other functions. The profiling calls indicates where, conceptually, the inline function is entered and exited. This means that addressable versions of such functions must be available. If all your uses of a function are expanded inline, this may mean an additional expansion of code size. If you use extern inline in your C code, an addressable version of such functions must be provided.  
  A function may be given the attribute no_instrument_function, in which case this instrumentation is not done. |
| -fno-ident              | Ignore the #ident directive.                                                                                                                                                                   |
| -fpack-struct           | Pack all structure members together without holes. Usually you would not want to use this option, since it makes the code sub-optimal, and the offsets of structure members won’t agree with system libraries. |
| -fpcc-struct-return     | Return short struct and union values in memory like longer ones, rather than in registers. This convention is less efficient, but it has the advantage of allowing capability between MPLAB C32 compiled files and files compiled with other compilers.  
  Short structures and unions are those whose size and alignment match that of an integer type. |
| -fno-short-double       | By default, the compiler uses a double type equivalent to float. This option makes double equivalent to long double. Mixing this option across modules can have unexpected results if modules share double data either directly through argument passage or indirectly through shared buffer space. Libraries provided with the product function with either switch setting. |
| -fshort-enums           | Allocate to an enum type only as many bytes as it needs for the declared range of possible values. Specifically, the enum type is equivalent to the smallest integer type which has enough room. |
| -fverbose-asm           |                                                                                                                                                                                            |
| -fno-verbose-asm        |                                                                                                                                                                                            |
| -fvolatile              | Consider all memory references through pointers to be volatile.                                                                                                                                 |
| -fvolatile-global       | Consider all memory references to external and global data items to be volatile. The use of this switch has no effect on static data.                                                                 |
| -fvolatile-static       | Consider all memory references to static data to be volatile.                                                                                                                                 |

1.9 COMPILING A SINGLE FILE ON THE COMMAND LINE

This section demonstrates how to compile and link a single file. For the purpose of this discussion, it is assumed the compiler is installed on your c: drive in a directory called Program Files\Microchip\MPLAB C32. Therefore the following applies:

- c:\Program Files\Microchip\MPLAB C32\pic32mx\include - Include directory for standard C header files.
- c:\Program Files\Microchip\MPLAB C32\pic32mx\include\proc - Include directory for PIC32MX device-specific header files.
- c:\Program Files\Microchip\MPLAB C32\pic32mx\lib - Library directory structure for standard libraries and startup files.
- c:\Program Files\Microchip\MPLAB C32\pic32mx\include\peripheral - Include directory for PIC32MX peripheral library include files.
- c:\Program Files\Microchip\MPLAB C32\pic32mx\lib\proc - Directory for device-specific linker script fragments, register definition files and configuration data may be found.
- c:\Program Files\Microchip\MPLAB C32\bin - Directory where the top level tools executables are located. The PATH environment variable may include this directory.

The following is a simple C program that adds two numbers. Create the following program with any text editor and save it as ex1.c.

```c
#include <p32xxxx.h>

unsigned int x, y, z;

unsigned int add(unsigned int a, unsigned int b)
{
    return(a+b);
}

int main(void)
{
    x = 2;
    y = 5;
    z = add(x,y);
    return 0;
}
```

The first line of the program includes the header file p32xxxx.h, which provides definitions for all special function registers on that part. For more information on processor header files, see Chapter 4. “Low Level Processor Control”.

Compile the program by typing the following at a DOS prompt:

C:/> pic32-gcc -o ex1.out ex1.c

The command line option -o ex1.out names the output executable file (if the -o option is not specified, then the output file is named a.out). The executable file may be loaded into the MPLAB IDE.

If a hex file is required, for example to load into a device programmer, then use the following command:

C:/> pic32-bin2hex ex1.out

This creates an Intel hex file named ex1.hex.
1.10 COMPILING MULTIPLE FILES ON THE COMMAND LINE

Move the Add() function into a file called add.c to demonstrate the use of multiple files in an application. That is:

File 1
/* ex1.c */
#include <p32xxxx.h>
int main(void);
unsigned int add(unsigned int a, unsigned int b);
unsigned int x, y, z;
int main(void)
{
    x = 2;
    y = 5;
    z = Add(x,y);
    return 0;
}

File 2
/* add.c */
#include <p32xxxx.h>
unsigned int
add(unsigned int a, unsigned int b)
{
    return(a+b);
}

Compile both files by typing the following at a DOS prompt:
C:\> pic32-gcc -o ex1.out ex1.c add.c

This command compiles the modules ex1.c and add.c. The compiled modules are linked with the compiler libraries and the executable file ex1.out is created.
Chapter 2. Library Environment

2.1 INTRODUCTION

This chapter discusses using the MPLAB C32 C libraries.

2.2 HIGHLIGHTS

Items discussed in this chapter are:
- Standard I/O
- Weak Functions
- “Helper” Header Files
- Multilibs

2.3 STANDARD I/O

The standard input/output library functions support two modes of operation, simple and full. The simple mode supports I/O via a two function interface on a single character device used for stdout, stdin and stderr. The full mode supports the complete set of standard I/O functions. The library will use full mode if the application calls fopen, otherwise simple mode is used.

Simple mode performs I/O using four functions, _mon_puts, _mon_write, _mon_getc and _mon_putc, to perform the raw device I/O. The default implementation of _mon_getc always returns failure (i.e., by default, character input is not available). The default implementation of _mon_putc writes a character to UART2. It is assumed that the application has performed any necessary initialization of the UART. The default implementations of _mon_puts and _mon_write both simply call _mon_putc iteratively. All four functions are defined as weak functions, and so may be overridden by the user application if different functionality is desired. See the MPLAB C32 C Compiler Libraries for detailed information on these functions.

An application using full mode must supply the standard low-level POSIX I/O functions open, read, write, lseek and close. No default implementations are provided. See the “MPLAB C32 C Compiler Libraries” (DS51685) for detailed information on these functions.

2.4 WEAK FUNCTIONS

The standard library provides a number of weak function implementations of low level interfaces. User applications which use this functionality will often implement more full featured versions of these functions. For details of the specific functions, see the “MPLAB C32 C Compiler Libraries” (DS51685).

As described above, the standard I/O library functions utilize a set of weak functions for simple output: _mon_write, _mon_putc, _mon_puts, and _mon_getc.

The standard startup code (See Section 5.7 “Startup and Initialization”) invokes a number of weak functions directly and provides weak handlers for bootstrap exceptions and general exceptions: _on_reset, _nmi_handler, _bootstrap_exception_handler, _general_exception_handler, and _on_bootstrap.
The standard library function `exit` calls the weak function `_exit` prior to returning. 
The standard library functions for signals, `signal` and `raise`, are implemented as 
weak functions which always fail. 
The standard library functions for locales, `setlocale` and `localeconv`, are 
implemented as weak functions which do nothing. 
The standard library function for accessing environment variables, `getenv`, is 
implemented as a weak function which always returns NULL.

2.5 “HELPER” HEADER FILES

2.5.1 sys/attrs.h

Macros are provided for many commonly used attributes in order to enhance user code 
readability.

<table>
<thead>
<tr>
<th>Macro</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>section</strong>(s)</td>
<td>Apply the section attribute with section name s.</td>
</tr>
<tr>
<td><strong>unique_section</strong></td>
<td>Apply the unique_section attribute.</td>
</tr>
<tr>
<td><strong>ramfunc</strong></td>
<td>Locate the attributed function in the RAM function code section.</td>
</tr>
<tr>
<td><strong>longramfunc</strong></td>
<td>Locate the attributed function in the RAM function code section and apply the longcall attribute.</td>
</tr>
<tr>
<td><strong>longcall</strong></td>
<td>Apply the longcall attribute.</td>
</tr>
<tr>
<td>__ISR(v,ipl)</td>
<td>Apply the interrupt attribute with priority level ipl and the vector attribute with vector number v.</td>
</tr>
<tr>
<td>__ISR_AT_VECTOR(v,ipl)</td>
<td>Apply the interrupt attribute with priority level ipl and the at_vector attribute with vector number v.</td>
</tr>
</tbody>
</table>

2.5.2 sys/kmem.h

System code may need to translate between virtual and physical addresses, as well as 
between kernel segment addresses. Macros are provided to make these translations 
easier and to determine the segment an address is in.

<table>
<thead>
<tr>
<th>Macro</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KVA_TO_PA(v)</td>
<td>Translate a kernel virtual address to a physical address.</td>
</tr>
<tr>
<td>PA_TO_KVA0(pa)</td>
<td>Translate a physical address to a KSEG0 virtual address.</td>
</tr>
<tr>
<td>PA_TO_KVA1(pa)</td>
<td>Translate a physical address to a KSEG1 virtual address.</td>
</tr>
<tr>

<td>Translate a KSEG0 virtual address to a KSEG1 virtual address.</td>
</tr>
<tr>
<td>KVA1_TO_KVA0(v)</td>
<td>Translate a KSEG1 virtual address to a KSEG0 virtual address.</td>
</tr>
<tr>
<td>IS_KVA(v)</td>
<td>Evaluates to 1 if the address is a kernel segment virtual address, zero otherwise.</td>
</tr>
<tr>
<td>IS_KVA0(v)</td>
<td>Evaluate to 1 if the address is a KSEG0 virtual address, zero otherwise.</td>
</tr>
<tr>
<td>IS_KVA1(v)</td>
<td>Evaluate to 1 if the address is a KSEG1 virtual address, zero otherwise.</td>
</tr>
<tr>
<td>IS_KVA01(v)</td>
<td>Evaluate to 1 if the address is either a KSEG0 or a KSEG1 virtual address, zero otherwise.</td>
</tr>
</tbody>
</table>

2.6 MULTILIBS

2.6.1 What are Multilibs?

With multilibs, target libraries are built multiple times with a permutated set of options. 
Multilibs are the resulting set of target libraries that are built with these options. When 
the compiler shell is called to compile and link an application, the shell chooses the 
version of the target library that has been built with the same options.
2.6.2 What Multilbs are Available for MPLAB C32 Language Tools?

The target libraries that are distributed with the MPLAB C32 C Compiler are built for the following options:

- Size versus speed (-Os vs. -O3)
- 16-bit versus 32-bit (-mips16 vs. -mno-mips16)
- Software floating-point versus no floating-point support (-msoft-float vs. -mno-float)

By default the MPLAB C32 language tools compile for -O0, -mno-mips16, and -msoft-float. Therefore, the options that we are concerned about are -Os or -O3, -mips16, and -mno-float. Libraries built with the following command line options are made available:

1. Default command line options
2. -Os
3. -O3
4. -mips16
5. -mno-float
6. -mips16 -mno-float
7. -Os -mips16
8. -Os -mno-float
9. -Os -mips16 -mno-float
10. -O3 -mips16
11. -O3 -mno-float
12. -O3 -mips16 -mno-float

2.6.3 Where are the Multilbs Directories?

By default, the MPLAB C32 language tools use the directory <install-directory>/lib/gcc/ to store the specific libraries and the directory <install-directory>/pic32mx/lib to store the target-specific libraries. Both of these directory structures contain subdirectories for each of the multilib combinations specified above. These subdirectories, respectively, are as follows:

1. .
2. ./size
3. ./speed
4. ./mips16
5. ./no-float
6. ./mips16/no-float
7. ./size/mips16
8. ./size/no-float
9. ./size/mips16/no-float
10. ./speed/mips16
11. ./speed/no-float
12. ./speed/mips16/no-float
2.6.4 Which Multilib Directory Are Selected?

This section looks at examples and provide details on which of the multilibs subdirectories are chosen.

1. `pic32-gcc foo.c`
   For this example, no command line options have been specified (i.e., the default command line options are being used). In this case, the . subdirectories are used.

2. `pic32-gcc -Os foo.c`
   For this example, the command line option for optimizing for size has been specified (i.e., -Os is being used). In this case, the ./size subdirectories are used.

3. `pic32-gcc -O2 foo.c`
   For this example, the command line option for optimizing has been specified, however, this command line option optimizes for neither size nor space (i.e., -O2 is being used). In this case, the . subdirectories are used.

4. `pic32-gcc -Os -mips16 foo.c`
   For this example, the command line options for optimizing for size and for MIPS16 code have been specified (i.e., -Os and -mips16 are being used). In this case, the ./size/mips16 subdirectories are used.
3.1 INTRODUCTION

Interrupt processing is an important aspect of most microcontroller applications. Interrupts may be used to synchronize software operations with events that occur in real time. When interrupts occur, the normal flow of software execution is suspended and special functions are invoked to process the event. At the completion of interrupt processing, previous context information is restored and normal execution resumes.

PIC32MX devices support multiple interrupts, from both internal and external sources. The devices allow high-priority interrupts to override any lower priority interrupts that may be in progress.

The MPLAB C32 C compiler provides full support for interrupt processing in C or inline assembly code. This chapter presents an overview of interrupt processing.

3.2 HIGHLIGHTS

Items discussed in this chapter are:

• Specifying an Interrupt Handler Function
• Associating a Handler Function with an Exception Vector
• Exception Handlers

3.3 SPECIFYING AN INTERRUPT HANDLER FUNCTION

An interrupt handler function handles the context save and restore to ensure that upon return from interrupt, the program context is maintained.

3.3.1 Handler Function Context Saving

The standard calling convention for C functions will already preserve zero, s0-s7, gp, sp, and fp. k0 and k1 are used by the compiler to access and preserve non-GPR context, but are always accessed atomically (i.e., in sequences with global interrupts disabled), so they need not be preserved actively. In addition to the standard registers, a handler function will actively preserve the a0-a3, t0-t9, v0, v1 and ra registers.

An interrupt handler function will also actively save and restore processor status registers that are utilized by the handler function. Specifically, the EPC, SR, hi and lo registers are preserved as context.

Handler functions specified as priority level 7 (highest priority) will use a shadow register set to preserve the general purpose registers, enabling lower latency entry into the application code of the handler function.

3.3.2 Marking a Function as an Interrupt Handler

A function is marked as a handler function via either the interrupt attribute or the interrupt pragma. Each method is functionally equivalent to the other. The interrupt is specified as handling interrupts of a specific priority level or for operating in single vector mode.

1. Note that pre-processor macros are not expanded in pragma directives.
# pragma interrupt function-name ipln [vector [@] vector-number [, vector-number-list]]
# pragma interrupt function-name single [vector [@] 0

Where n is in the range of 0..7, inclusive. The iplx specifier may be all uppercase or all lowercase.

The function definition for a handler function indicated by an interrupt pragma must follow in the same translation unit as the pragma itself.

The interrupt attribute will also indicate that a function definition is an interrupt handler. It is functionally equivalent to the interrupt pragma.

For example, the definitions of foo below both indicate that it is an interrupt handler function for an interrupt of priority 4.

```c
#pragma interrupt foo ipl4
void foo (void)
```

is functionally equivalent to

```c
void __attribute__ ((interrupt(ipl4))) foo (void)
```

### 3.4 ASSOCIATING A HANDLER FUNCTION WITH AN EXCEPTION VECTOR

There are 64 exception vectors, numbered 0..63 inclusive. Each interrupt source is mapped to an exception vector as specified in the device data sheet. By default, four words of space are reserved at each vector address for a dispatch to the handler function for that exception source.

An interrupt handler function can be associated with an interrupt vector either as the target of a dispatch function located at the exception vector address, or as being located directly at the exception vector address. A single handler function can be the target of multiple dispatch functions.

The association of a handler function to one or more exception vector addresses is specified via a clause of the interrupt pragma, a separate vector pragma, or a vector attribute on the function declaration.

#### 3.4.1 Interrupt Pragma Clause

The interrupt pragma has an optional vector clause following the priority specifier.

```c
#pragma interrupt function-name ipl-specifier [vector [@] vector-number [, vector-number-list]]
```

A dispatch function targeting the specified handler function will be created at the exception vector address for the specified vector numbers. If the first vector number is specified with a preceding "@" symbol, the handler function itself will be located there directly.

For example, the following pragma specifies that function foo will be created as an interrupt handler function of priority four. foo will be located at the address of exception vector 54. A dispatch function targeting foo will be created at exception vector address 34.

```c
#pragma interrupt foo ipl4 vector @54, 34
```

The following pragma specifies that function bar will be created as an interrupt handler function of priority five. bar will be located in general purpose program memory (.text section). A dispatch function targeting bar will be created at exception vector address 23.

```c
#pragma interrupt bar ipl5 vector 23
```
3.4.2 Vector Pragma

The vector pragma creates one or more dispatch functions targeting the indicated function. For target functions specified with the interrupt pragma, this functions as if the vector clause had been used. The target function of a vector pragma can be any function, including external functions implemented in assembly or by other means.

```c
#pragma vector function-name vector vector-number [, vector-number-list]
```

The following pragma defines a dispatch function targeting foo at exception vector address 54.

```c
#pragma vector foo 54
```

3.4.3 Vector Attribute

A handler function can be associated with one or more exception vector addresses via an attribute. The at_vector attribute indicates that the handler function should itself be placed at the exception vector address. The vector attribute indicates that a dispatch function should be created at the exception vector address(es).

For example, the following declaration specifies that function foo will be created as an interrupt handler function of priority four. foo will be located at the address of exception vector 54.

```c
void __attribute__((interrupt(ipl4))) __attribute__((at_vector(54))) foo (void)
```

The following declaration specifies that function foo will be created as an interrupt handler function of priority four. Define dispatch functions targeting foo at exception vector addresses 52 and 53.

```c
void __attribute__((interrupt(ipl4))) __attribute__((vector(53, 52))) foo (void)
```

3.5 EXCEPTION HANDLERS

The PIC32MX devices also have two exception vectors for non-interrupt exceptions. These exceptions are grouped into bootstrap exceptions and general exceptions.

3.5.1 Bootstrap Exception

A reset exception is any exception which occurs while bootstrap code is running (StatusBEV=1). All reset exceptions are vectored to 0xBFC00380. At this location the MPLAB C32 toolchain places a branch instruction targeting a function named _bootstrap_exception_handler(). In the standard library, a default weak version of this function is provided which merely goes into an infinite loop. If the user application provides an implementation of _bootstrap_exception_handler(), that implementation will be used instead.

3.5.2 General Exception

A general exception is any non-interrupt exception which occurs during program execution outside of bootstrap code (StatusBEV=0). General exceptions are vectored to offset 0x180 from EBase. At this location the MPLAB C32 toolchain places a branch instruction targeting a function named _general_exception_context(). The provided implementation of this function saves context, calls an application handler function, restores context and performs a return from exception instruction. The context saved is the hi and lo registers and all general purpose registers except s0-s8, which are defined to be preserved by all called functions and so are not necessary to actively save again here.
The values of the Cause and Status registers are passed to the application handler function (_general_exception_handler()). If the user application provides an implementation of _general_exception_context(), that implementation will be used instead.

void _general_exception_handler (unsigned cause, unsigned status);

A weak default implementation of _general_exception_handler() is provided in the standard library which merely goes into an infinite loop. If the user application provides an implementation of _general_exception_handler(), that implementation will be used instead.
Chapter 4. Low Level Processor Control

4.1 INTRODUCTION

This chapter discusses access to the low level registers and configuration of the PIC32MX devices.

4.2 HIGHLIGHTS

Items discussed in this chapter are:
- Generic Processor Header File
- Processor Support Header Files
- Peripheral Library Functions
- Special Function Register Access
- CP0 Register Access
- Configuration Bit Access

4.3 GENERIC PROCESSOR HEADER FILE

The generic processor header file is a C file that includes the correct processor-specific header file based on the processor specified with the -mprocessor command line option. The generic processor header file is located in:
```
c:\Program Files\Microchip\MPLAB C32\pic32mx\include
```
where
```
c:\Program Files\Microchip\MPLAB C32
```
is the directory in which the MPLAB C32 toolchain was installed. Besides including the correct processor-specific header file, the generic processor header file also provides #defines which allow the use of conventional register names from within assembly language files.

To include the generic processor header file, use the following from within your source code:
```
#include <p32xxxx.h>
```

Inclusion of the generic processor header file allows your source code to be compiled for any of the processors supported by the MPLAB C32 toolchain without having to change the file which is being included.

4.4 PROCESSOR SUPPORT HEADER FILES

The processor-specific header files are files that contain external declarations for the Special Function Registers (SFRs) for use in either C or assembly. By convention, each SFR is named using the same name that appears in the data sheet – for example, `WDTCON` for the watchdog timer control register. If the register has individual bits that may be of interest, there is also be a structure typedef defined for that SFR, where the name of the structure typedef is the name of the register with `bits_t` appended – for example, `__WDTCONbits_t`. The individual bits (or bit fields) are named in the structure using the names in the data sheet. For example in the PIC32MX360F512L processor-specific header file, the `WDTCON` register for use with C is declared as:
extern volatile unsigned int WDTCON __attribute__((section("sfrs")));  
typedef union {
    struct {
        unsigned WDTCLR:1;
        unsigned :1;
        unsigned SWDTPS0:1;
        unsigned SWDTPS1:1;
        unsigned SWDTPS2:1;
        unsigned SWDTPS3:1;
        unsigned SWDTPS4:1;
        unsigned :8;
        unsigned ON:1;
    };
    struct {
        unsigned :2;
        unsigned WDTPSTA:5;
        unsigned :1;
        unsigned PWRTPSTA:3;
    };
    struct {
        unsigned w:32;
    };
} __WDTCONbits_t;

extern volatile __WDTCONbits_t WDTCONbits asm ("WDTCON") __attribute__((section("sfrs")));

Note: The symbols WDTCON and WDTCONbits refer to the same register and resolve to the same address as can be seen by the declaration for WDTCONbits.

For use with assembly, the WDTCON register is declared as: .extern WDTCON.

The processor-specific header files are located in c:\Program Files\Microchip\MPLAB C32\pic32mx\include\proc, where c:\Program Files\Microchip\MPLAB C32 is the directory in which the MPLAB C32 toolchain was installed. To include a processor-specific header file, it is recommended that you include the generic processor header file (see Section 4.3 “Generic Processor Header File”), however, if you would like to specifically call out the processor-specific header file, use the following from your source file (example assumes inclusion of the processor-specific header file for the PIC32MX360F512L):

#include <proc/p32mx360f512l.h>

4.5 PERIPHERAL LIBRARY FUNCTIONS

Many of the peripherals of the PIC32MX devices are supported by the peripheral library functions provided with the compiler tools. See the “MPLAB C32 C Compiler Libraries” (DS51685) for details on the functions provided.
4.6 SPECIAL FUNCTION REGISTER ACCESS

There are three steps to follow when using SFRs in an application.

1. Include either the generic processor header file (i.e., p32xxxx.h) or the processor-specific header file for the appropriate device (e.g., proc/p32mx360f512l.h).

```
#include <p32xxxx.h>
```

2. Access SFRs like any other C variables. The source code can write to and/or read from the SFRs. For example, the following statement clears all the bits to zero in the special function register for Timer 1:

```
TMR1 = 0;
```

The next statement enables the Watchdog Timer:

```
WDTCONbits.ON = 1;
```

3. Link with the default linker script or include the processor.o file for the appropriate processor in your project.

4.7 CP0 REGISTER ACCESS

4.7.1 CP0 Register Definitions Header File

The CP0 register definitions header file (cp0defs.h) is a file that contains definitions for the CP0 registers and their fields. In addition, it contains macros for accessing the CP0 registers. The CP0 register definitions header file is located in c:\Program Files\Microchip\MPLAB C32\pic32mx\include, where c:\Program Files\Microchip\MPLAB C32 is the directory in which the MPLAB C32 toolchain was installed. The CP0 register definitions header file was designed to work with either Assembly or C files.

The CP0 register definitions header file is dependent on macros defined within the processor generic header file (See Section 4.3 “Generic Processor Header File”). To include the CP0 register definitions header file, use the following from within your source code:

```
#include <p32xxxx.h>
```

4.7.2 CP0 Register Definitions

When the CP0 register definitions header file is included from an Assembly file, the CP0 registers are defined as:

```
#define _CP0_REGISTER_NAME $register_number, select_number
```

For example, the IntCtl register is defined as:

```
#define _CP0_INTCTL $12, 1
```

When the CP0 register definitions header file is included from a C file, the CP0 registers and selects are defined as:

```
#define _CP0_REGISTER_NAME register_number
#define _CP0_REGISTER_NAME_SELECT select_number
```

For example, the IntCtl register is defined as:

```
#define _CP0_INTCTL 12
#define _CP0_INTCTL_SELECT 1
```

4.7.3 CP0 Register Field Definitions

When the CP0 register definitions header file is included from either an Assembly or a C file, three #defines exist for each of the CP0 register fields.

```
_CP0_REGISTER_NAME_FIELD_NAME_POSITION – the starting bit location
```
_CP0_REGISTER_NAME_FIELD_NAME_MASK – the bits that are part of this field are set
_CP0_REGISTER_NAME_FIELD_NAME_LENGTH – the number of bits that this field occupies

For example the vector spacing field of the IntCtl register has the following defines:

#define _CP0_INTCTL_VS_POSITION 0x00000005
#define _CP0_INTCTL_VS_MASK 0x000003E0
#define _CP0_INTCTL_VS_LENGTH 0x00000005

4.7.4 CP0 Access Macros

When the CP0 register definitions header file is included from a C file, CP0 access macros are defined. Each CP0 register may have up to six different access macros defined:

| _CP0_GET_REGISTER_NAME () | Returns the value for register, REGISTER_NAME. |
| _CP0_SET_REGISTER_NAME (val) | Sets the register, REGISTER_NAME, to val, and returns void. Only defined for registers that contain a writable field. |
| _CP0_XCH_REGISTER_NAME (val) | Sets the register, REGISTER_NAME, to val, and returns the previous register value. Only defined for registers that contain a writable field. |
| _CP0_BIS_REGISTER_NAME (set) | Sets the register, REGISTER_NAME, to (reg |= set), and returns the previous register value. Only defined for registers that contain writable bit fields. |
| _CP0_BIC_REGISTER_NAME (clr) | Sets the register, REGISTER_NAME, to (reg &= ~clr), and returns the previous register value. Only defined for registers that contain writable bit fields. |
| _CP0_BCS_REGISTER_NAME (clr, set) | Sets the register, REGISTER_NAME, to (reg = (reg & ~clr) | set), and returns the previous register value. Only defined for registers that contain writable bit fields. |

4.8 CONFIGURATION BIT ACCESS

4.8.1 #pragma config

The #pragma config directive specifies the processor-specific configuration settings (i.e., configuration bits) to be used by the application. Refer to the “PIC32MX Configuration Settings” on-line help for more information.

Configuration settings may be specified with multiple #pragma config directives. MPLAB C32 C compiler verifies that the configuration settings specified are valid for the processor for which it is compiling. If a given setting in the configuration word has not been specified in any #pragma config directive, the bits associated with that setting default to the unprogrammed value.

For each configuration word for which a setting is specified with the #pragma config directive, the compiler generates a read-only data section named .config_address, where address is the hexadecimal representation of the address of the configuration word. For example, if a configuration setting was specified for the configuration word located at address 0xBFC02FFC, a read-only data section named .config_BFC02FFC would be created.
4.8.1.1 SYNTAX

#pragma-config-directive:
    # pragma config setting-list

setting-list:
    setting
    | setting-list, setting
setting:
    setting-name = value-name

The setting-name and value-name are device specific and can be determined by utilizing the PIC32MX Configuration Settings document.

4.8.1.2 EXAMPLE

The following example shows how the #pragma config directive might be utilized. The example does the following:

• Enables the Watchdog Timer,
• Sets the Watchdog Postscaler to 1:128, and
• Selects the HS Oscillator for the Primary Oscillator

    #pragma config FWDTEN = ON, WDTPS = PS128
    #pragma config POSCMOD = HS

... void main (void)
{
    ...}
}
Chapter 5. Compiler Runtime Environment

5.1 INTRODUCTION

This chapter discusses the MPLAB C32 C compiler runtime environment.

5.2 HIGHLIGHTS

Items discussed in this chapter are:

- Register Conventions
- Stack Usage
- Heap Usage
- Function Calling Convention
- Startup and Initialization
- Contents of the Default Linker Script
- RAM Functions

5.3 REGISTER CONVENTIONS

TABLE 5-1: REGISTER CONVENTIONS

</tbody>
</table>
5.4 STACK USAGE

The MPLAB C32 C compiler dedicates general purpose register 29 as the software Stack Pointer. All processor stack operations, including function call, interrupts and exceptions use the software stack. The stack grows downward from high addresses to low addresses.

By default, the size of the stack is 1024 bytes. The size of the stack may be changed by specifying the size on the linker command line using the --defsym_min_stack_size linker command line option. An example of allocating a stack of 2048 bytes using the command line is:

```
pic32-gcc foo.c -Wl,--defsym,_min_stack_size=2048
```

The runtime stack grows downward from higher addresses to lower addresses (see Figure 5-1). The compiler uses two working registers to manage the stack:

- Register 29 (sp) – This is the Stack Pointer. It points to the next free location on the stack.
- Register 30 (fp) – This is the Frame Pointer. It points to the current function’s frame. Each function, if required, creates a new frame from which automatic and temporary variables are allocated. Compiler optimization may eliminate Stack Pointer references via the Frame Pointer to equivalent references via the Stack Pointer. This optimization allows the Frame Pointer to be used as a general purpose register.

### FIGURE 5-1: STACK FRAME

Stack grows toward lower addresses

- Space for more arguments if necessary
- Space for argument 4
- Space for argument 3
- Space for argument 2
- Space for argument 1
- Local variables and temporary values
- Register save area
- Space for arguments used in function calls
5.5 HEAP USAGE

The C runtime heap is an uninitialized area of data memory that is used for dynamic memory allocation using the standard C library dynamic memory management functions, `calloc`, `malloc` and `realloc`. If you do not use any of these functions, then you do not need to allocate a heap. By default, a heap is not created.

If you do want to use dynamic memory allocation, either directly, by calling one of the memory allocation functions, or indirectly, by using a standard C library function that uses one of these functions, then a heap must be created. A heap is created by specifying its size on the linker command line using the `--defsym_min_heap_size` linker command line option. An example of allocating a heap of 512 bytes using the command line is:

```
pic32-gcc foo.c -Wl,--defsym,_min_heap_size=512
```

The linker allocates the heap immediately before the stack.

5.6 FUNCTION CALLING CONVENTION

The Stack Pointer is always aligned on a 4-byte boundary.

- All integer types smaller than a 32-bit integer are first converted to a 32-bit value. The first four 32 bits of arguments are passed via registers `a0-a3` (see Table 5-2 for how many registers are required for each data type).
- Although some arguments may be passed in registers, space is still allocated on the stack for all arguments to be passed to a function (see Figure 5-2).
- When calling a function:
  - Registers `a0-a3` are used for passing arguments to functions. Values in these registers are not preserved across function calls.
  - Registers `t0-t7` and `t8-t9` are caller saved registers. The calling function must push these values onto the stack for the registers’ values to be saved.
  - Registers `s0-s7` are called saved registers. The function being called must save any of these registers it modifies.
  - Register `s8` is a saved register if the optimizer eliminates its use as the Frame Pointer. `s8` is a reserved register otherwise.
  - Register `ra` contains the return address of a function call.

5.7  STARTUP AND INITIALIZATION

5.7.1  Provisions

The following provisions are made regarding the runtime model:

- Kernel mode only
- KSEG1 only
- RAM functions are attributed with \_ramfunc\_ or \_longramfunc\_, meaning that all RAM functions end up in the .ramfunc section

5.7.2  PIC32MX Startup Code

The PIC32MX startup code must perform the following:

1. Jump to NMI Handler If an NMI Occurred
2. Initialize Stack Pointer and Heap
3. Initialize Global Pointer
4. Call “On Reset” Procedure
5. Clear Uninitialized Data Sections
6. Copy Initialized Data from Program Flash to Data Memory
7. Copy RAM Functions from Program Flash to Data Memory
8. Initialize Bus Matrix Registers
9. Initialize CP0 Registers
10. Trace Control 2 Register (\texttt{TraceControl2} – CP0 Register 23, Select 2)
11. Call “On Bootstrap” Procedure
12. Change Location of Exception Vectors
13. Call Main

5.7.2.1  JUMP TO NMI HANDLER IF AN NMI OCCURRED

If an NMI caused entry to the reset vector, a jump to an NMI handler procedure (_nmi_handler) occurs. A weak version of the NMI handler procedure is provided that performs an \texttt{ERET}. The _nmi_handler function must be attributed with \texttt{nomips16} [e.g., \texttt{\_attribute\_\((\texttt{nomips16})\)}] since the startup code jumps to this function.

5.7.2.2  INITIALIZE STACK POINTER AND HEAP

The Stack Pointer (sp) register must be initialized in the startup code. To enable the startup code to initialize the sp register, the linker script must initialize a variable which points to the end of KSEG1 data memory\(^1\). This variable is named _stack. The user can change the minimum amount of stack space allocated by providing the command line option --defsym _min_stack_size=N to the linker. _min_stack_size is provided by the linker script with a default value of 1024.

On a similar note, the user may wish to utilize a heap with their application. While the startup code does not need to initialize the heap, the standard C libraries (\texttt{sbrk}) must be made aware of the heap location and its size. The linker script creates a variable to identify the beginning of the heap. The location of the heap is the end of the utilized KSEG1 data memory. This variable is named _heap. The user can change the minimum amount of heap space allocated by providing the command line option --defsym _min_heap_size=M to the linker. _min_heap_size is provided by the

\(^1\) The end of data memory are different based on whether RAM functions exist. If RAM functions exist, then part of the DRM must be configured for kernel program to contain the RAM functions, and the Stack Pointer is located one word prior to the beginning of the DRM kernel program boundary address. If RAM functions do not exist, then the Stack Pointer is located at the true end of DRM.
The linker script with a default value of 0. If the heap is used when the heap size is set to zero, the behavior is the same as when the heap usage exceeds the minimum heap size. Namely, it overflows into the space allocated for the stack.

The heap and the stack use the unallocated KSEG1 data memory, with the heap starting from the end of allocated KSEG1 data memory and growing upwards towards the stack while the stack starts at the end of KSEG1 data memory and grows downwards towards the heap. If enough space is not available based on the minimum amount of heap size and stack size requested, the linker issues an error.

![Stack and Heap Layout](image)

**FIGURE 5-3: STACK AND HEAP LAYOUT**

![Stack and Heap Layout with RAM Functions](image)

**FIGURE 5-4: STACK AND HEAP LAYOUT WITH RAM FUNCTIONS**

### 5.7.2.3 INITIALIZE GLOBAL POINTER

The compiler toolchain supports global pointer (gp) relative addressing. Loads and stores to data lying within 32KB of either side of the address stored in the gp register can be performed in a single instruction using the gp register as the base register.
Without the global pointer, loading data from a static memory area takes two instructions – one to load the most significant bits of the 32-bit constant address computed by the compiler/linker and one to do the data load.

To utilize gp-relative addressing, the compiler and assembler must group all of the “small” variables and constants into one of the following sections:

- .lit4.
- .lit8
- .sdata.
- .sdata.*
- .gnu.linkonce.s.*
- .gnu.linkonce.sb.*

The linker must then group all of the above input sections together. The run-time startup code must initialize the gp register to point to the “middle” of this output section. To enable the startup code to initialize the gp register, the linker script must initialize a variable which is 32 KB from the start of the output section containing the “small” variables and constants. This variable is named _gp (to match core linker scripts). Besides being initialized in the standard GPR set, the global pointer must also be initialized in the register shadow set.

FIGURE 5-5: GLOBAL POINTER LOCATION

5.7.2.4 CALL "ON RESET" PROCEDURE

A procedure is called after initializing a minimum ‘C’ context. This procedure allows users to perform actions almost immediately on reset of the device. An empty weak version of this procedure (_on_reset) is provided with the startup code. Special considerations needs to be taken by the user if this procedure is written in ‘C’. Most importantly, statically allocated variables are not initialized (with either the specified initializer or a zero as required for uninitialized variables).

5.7.2.5 CLEAR UNINITIALIZED DATA SECTIONS

There are two uninitialized data sections—.sbss and .bss. The .sbss section is a data segment containing uninitialized variables less than or equal to n bytes where n is determined by the -Gn command line option. The .bss section is a data segment containing uninitialized variables not included in .sbss.
The C standard requires that the uninitialized data sections be initialized to 0 on startup. In order to initialize these sections, the linker script must allocate these sections contiguously and initialize two variables – one for the start address of the uninitialized data section and one for the end address of the uninitialized data section. The startup code clears all data memory locations between these two addresses. These variables are named _bss_begin and _bss_end, respectively.

5.7.2.6 COPY INITIALIZED DATA FROM PROGRAM FLASH TO DATA MEMORY

Similar to uninitialized data sections, four initialized data sections exist: .sdata, .data, .lit4, and .lit8. The .sdata section is a data segment containing initialized variables less than or equal to \( n \) bytes where \( n \) is determined by the \(-Gn\) command line option. The .data section is a data segment containing initialized variables not included in .sdata. The .lit4 and .lit8 sections contain constants (usually floating-point) which the assembler decides to store in memory rather than in the instruction stream.

On startup, a copy of the initialized data exists in the program flash. This data must be copied to data memory. To facilitate this, the linker script must initialize three variables—one for the start address of the image in program flash, one for the start address of the section in data memory, and one for the end address of the section in data memory. The startup code copies all data memory locations from program flash image to data memory using these variables. These variables are named _data_image_begin, _data_begin, and _data_end, respectively.
5.7.2.7 COPY RAM FUNCTIONS FROM PROGRAM FLASH TO DATA MEMORY

RAM functions are similar to initialized data, except that the data that exists in the program flash represents functions instead of initial values for symbols. Similar to the way that initialized data is copied from program flash to data memory, the linker script must initialize three variables—one for the start address of the image in program flash, one for the start address of the section in data memory and one for the end address of the section in data memory. The startup code copies the memory locations from the program flash image to the data memory using these variables. These variables are named _ramfunc_image_begin, _ramfunc_begin, and _ramfunc_end, respectively.

5.7.2.8 INITIALIZE BUS MATRIX REGISTERS

The bus matrix registers (BMXDKPBA, BMXDUDBA, BMXDUPBA) should be initialized by the startup code if any RAM functions exist, otherwise, these registers should not be modified. To determine whether any RAM functions exist in the application, the linker script provides a variable that contains the length of the .ramfunc section\(^1\). This

---

1. All functions attributed with __ramfunc__ or __longramfunc__ are placed in the .ramfunc section.
variable are named _ramfunc_length. In addition, the linker script provides three
variables that contain the address of the bus matrix registers. These variables are
named _bmxdkpba_address, _bmxudba_address, and _bmxdupba_address.
The following calculations are used to calculate these addresses:

\[
\begin{align*}
_bmxdkpba_address &= _\text{ramfunc}_\text{begin} - \\
& \text{ORIGIN}(${\text{DATA\_MEMORY\_LOCATION}}) ; \\
_bmxudba_address &= \text{LENGTH}(${\text{DATA\_MEMORY\_LOCATION}}) ; \\
_bmxdupba_address &= \text{LENGTH}(${\text{DATA\_MEMORY\_LOCATION}}) ;
\end{align*}
\]

The linker script ensures that RAM functions are aligned to a 2K alignment boundary
as is required by the BMXDKPBA register.

**FIGURE 5-9: BUS MATRIX INITIALIZATION**

5.7.2.9 INITIALIZE CP0 REGISTERS

The CP0 registers are initialized in the following order:

1. Count register
2. Compare register
3. EBase register
4. IntCtl register
5. Cause register
6. Status register

5.7.2.9.1 Hardware Enable Register (HWREna – CP0 Register 7, Select 0)

This register contains a bit mask that determines which hardware registers are
accessible via the RDHWR instruction. Privileged software may determine which of the
hardware registers are accessible by the RDHWR instruction. In doing so, a register may
be virtualized at the cost of handling a Reserved Instruction Exception, interpreting the
instruction, and returning the virtualized value. For example, if it is not desirable to
provide direct access to the Count register, access to the register may be individually
disabled and the return value can be virtualized by the operating system.

No initialization is performed on this register in the PIC32MX startup code.
5.7.2.9.2  Bad Virtual Address Register (BadVAddr – CP0 Register 8, Select 0)
This register is a read-only register that captures the most recent virtual address that
cau sed an Address Error exception (AdEL or AdES).
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.3  Count Register (Count – CP0 Register 9, Select 0)
This register acts as a timer, incrementing at a constant rate, whether or not an
instruction is executed, retired, or any forward progress is made through the pipeline.
The counter increments every other clock, if the DC bit in the Cause register is 0. The
Count register can be written for functional or diagnostic purposes, including at reset
or to synchronize processors. By writing the CountDM bit in the Debug register, it is
possible to control whether the Count register continues incrementing while the
processor is in debug mode.
This register is cleared in the PIC32MX startup code.

5.7.2.9.4  Compare Register (Compare – CP0 Register 11, Select 0)
This register acts in conjunction with the Count register to implement a timer and timer
interrupt function. The timer interrupt is an output of the core. The Compare register
maintains a stable value and does not change on its own. When the value of the Count
register equals the value of the Compare register, the SI_TimerInt pin is asserted.
This pin remains asserted until the Compare register is written. The SI_TimerInt pin
can be fed back into the core on one of the interrupt pins to generate an interrupt. For
diagnostic purposes, the Compare register is a read/write register. In normal use,
however, the Compare register is write-only. Writing a value to the Compare register,
as a side effect, clears the timer interrupt.
This register is set to 0xFFFFFFFF in the PIC32MX startup code.

5.7.2.9.5  Status Register (Status – CP0 Register 12, Select 0)
This register is a read/write register that contains the operating mode, interrupt
enabling, and the diagnostic states of the processor. Fields of this register combine to
create operating modes for the processor.
The following settings are initialized by the PIC32MX startup code
(0b0000000000xx0?0000000000000000):
• Access to Coprocessor 0 not allowed in user mode (CU0 = 0)
• User mode uses configured endianess (RE = 0)
• No change to exception vectors location (BEV = no change)
• No change to flag bits that indicate reason for entry to the reset exception vector
(SR, NMI = no change)
• If CorExtend User Defined Instructions have been implemented
  (ConfigUDI == 1), CorExtend is enabled (CEE = 1), otherwise, CorExtend is
disabled (CEE = 0).
• Interrupt masks are cleared to disable any pending interrupt requests (IM7..IM2
  = 0, IM1..IM0 = 0)
• Interrupt priority level is 0 (IPL = 0)
• Base mode is Kernel mode (UM = 0)
• Error level is normal (ERL = 0)
• Exception level is normal (EXL = 0)
• Interrupts are disabled (IE = 0)
5.7.2.9.6 Interrupt Control Register (IntCtl – CP0 Register 12, Select 1)
This register controls the expanded interrupt capability added in Release 2 of the Architecture, including vectored interrupts and support for an external interrupt controller.

This register contains the vector spacing for interrupt handling. The vector spacing portion of this register (bits 9..5) is initialized with the value of the _vector_spacing symbol by the PIC32MX startup code. All other bits are set to 1.

5.7.2.9.7 Shadow Register Control Register (SRSCtl – CP0 Register 12, Select 2)
This register controls the operation of the GPR shadow sets in the processor.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.8 Shadow Register Map Register (SRSMap – CP0 Register 12, Select 3)
This register contains eight 4-bit fields that provide the mapping from a vector number to the shadow set number to use when servicing such an interrupt. The values from this register are not used for a non-interrupt exception, or a non-vectored interrupt (CauseIV = 0 or IntCtlVS = 0). In such cases, the shadow set number comes from SRSCtlESS. If SRSCtlHSS is zero, the results of a software read or write of this register are UNPREDICTABLE. The operation of the processor is UNDEFINED if a value is written to any field in this register that is greater than the value of SRSCtlHSS. The SRSMap register contains the shadow register set numbers for vector numbers 7..0. The same shadow set number can be established for multiple interrupt vectors, creating a many-to-one mapping from a vector to a single shadow register set number.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.9 Cause Register (Cause – CP0 Register 13, Select 0)
This register primarily describes the cause of the most recent exception. In addition, fields also control software interrupt requests and the vector through which interrupts are dispatched. With the exception of the DC, IV, and IP1..IP0 fields, all fields in the Cause register are read-only. Release 2 of the Architecture added optional support for an External Interrupt Controller (EIC) interrupt mode, in which IP7..IP2 are interpreted as the Requested Interrupt Priority Level (RIPL).

The following settings are initialized by the PIC32MX startup code:
• Enable counting of Count register (DC = no change)
• Use the special exception vector (16#200)(IV = 1)
• Disable software interrupt requests (IP1..IP0 = 0)

5.7.2.9.10 Exception Program Counter (EPC – CP0 Register 14, Select 0)
This register is a read/write register that contains the address at which processing resumes after an exception has been serviced. All bits of the EPC register are significant and must be writable. For synchronous (precise) exceptions, the EPC contains one of the following:
• The virtual address of the instruction that was the direct cause of the exception
• The virtual address of the immediately preceding branch or jump instruction, when the exception causing instruction is a branch delay slot and the Branch Delay bit in the Cause register is set.

On new exceptions, the processor does not write to the EPC register when the EXL bit in the Status register is set, however, the register can still be written via the MTC0 instruction.
No initialization is performed on this register in the PIC32MX startup code.
5.7.2.9.11 Processor Identification Register (PRid – CP0 Register 15, Select 0)
This register is a 32-bit read-only register that contains information identifying the
manufacturer, manufacturer options, processor identification, and revision level of the
processor.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.12 Exception Base Register (EBase – CP0 Register 15, Select 1)
This register is a read/write register containing the base address of the exception
vectors used when StatusBEV equals 0, and a read-only CPU number value that may
be used by software to distinguish different processors in a multi-processor system.
The EBase register provides the ability for software to identify the specific processor
within a multi-processor system, and allows the exception vectors for each processor
to be different, especially in systems composed of heterogeneous processors. Bits
31..12 of the EBase register are concatenated with zeros to form the base of the
exception vectors when StatusBEV is 0. The exception vector base address comes
from fixed defaults when StatusBEV is 1, or for any EJTAG Debug exception. The reset
state of bits 31..12 of the EBase register initialize the exception base register to
16#80000000, providing backward compatibility with Release 1 implementations. Bits
31..30 of the EBase register are fixed with the value 2#10 to force the exception base
address to be in KSEG0 or KSEG1 unmapped virtual address segments.
If the value of the exception base register is to be changed, this must be done with
StatusBEV equal 1. The operation of the processor is UNDEFINED if the Exception
Base field is written with a different value when StatusBEV is 0.
Combining bits 31..30 with the Exception Base field allows the base address of the
exception vectors to be placed at any 4K byte page boundary. If vectored interrupts are
used, a vector offset greater than 4K byte can be generated. In this case, bit 12 of the
Exception Base field must be zero. The operation of the processor is UNDEFINED if
software writes bit 12 of the Exception Base field with a 1 and enables the use of a
vectored interrupt whose offset is greater than 4K bytes from the exception base
address.
This register is initialized with the value of the _ebase_address symbol by the
PIC32MX startup code. _ebase_address is provided by the linker script with a
default value of the start of KSEG1 program memory. The user can change this value
by providing the command line option --defsym _ebase_address=A to the linker.

5.7.2.9.13 Config Register (Config – CP0 Register 16, Select 0)
This register specifies various configuration and capabilities information. Most of the
fields in the Config register are initialized by hardware during the Reset exception
process, or are constant.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.14 Config1 Register (Config1 – CP0 Register 16, Select 1)
This register is an adjunct to the Config register and encodes additional information
about the capabilities present on the core. All fields in the Config1 register are
read-only.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.15 Config2 Register (Config2 – CP0 Register 16, Select 2)
This register is an adjunct to the Config register and is reserved to encode additional
capabilities information. Config2 is allocated for showing the configuration of level 2/3
caches. These fields are reset to 0 because L2/L3 caches are not supported on the
core. All fields in the Config2 register are read-only.
No initialization is performed on this register in the PIC32MX startup code.
5.7.2.9.16 Config3 Register (Config3 – CP0 Register 16, Select 3)
This register encodes additional capabilities. All fields in the Config3 register are read-only.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.17 Debug Register (Debug – CP0 Register 23, Select 0)
This register is used to control the debug exception and provide information about the cause of the debug exception and when re-entering at the debug exception vector due to a normal exception in debug mode. The read-only information bits are updated every time the debug exception is taken or when a normal exception is taken when already in debug mode. Only the DM bit and the EJTAGver field are valid when read from non-debug mode. The values of all other bits and fields are UNPREDICTABLE. Operation of the processor is UNDEFINED if the Debug register is written from non-debug mode.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.9.18 Trace Control Register (TraceControl – CP0 Register 23, Select 1)
This register provides control and status information. The TraceControl register is only implemented if the EJTAG Trace capability is present.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10 TRACE CONTROL 2 REGISTER (TraceControl2 – CP0 REGISTER 23, SELECT 2)
This register provides additional control and status information. The TraceControl2 register is only implemented if the EJTAG Trace capability is present.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10.1 User Trace Data Register (UserTraceData – CP0 Register 23, Select 3)
When this register is written to, a trace record is written indicating a type 1 or type 2 user format. This type is based on the UT bit in the TraceControl register. This register cannot be written in consecutive cycles. The trace output data is UNPREDICTABLE if this register is written in consecutive cycles. The UserTraceData register is only implemented if the EJTAG Trace capability is present.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10.2 TraceBPC Register (TraceBPC – CP0 Register 23, Select 4)
This register is used to control start and stop of tracing using an EJTAG hardware breakpoint. The hardware breakpoint would then be set as a triggered source and optionally also as a Debug exception breakpoint. The TraceBPC register is only implemented if both the hardware breakpoints and the EJTAG Trace cap are present.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10.3 Debug2 Register (Debug2 – CP0 Register 23, Select 5)
This register holds additional information about Complex Breakpoint exceptions. The Debug2 register is only implemented if complex hardware breakpoints are present.
No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10.4 Debug Exception Program Counter (DEPC – CP0 Register 24, Select 0)
This register is a read/write register that contains the address at which processing resumes after a debug exception or debug mode exception has been serviced. For synchronous (precise) debug and debug mode exceptions, the DEPC contains either:
• The virtual address of the instruction that was the direct cause of the debug exception, or
• The virtual address of the immediately preceding branch or jump instruction, when the debug exception causing instruction is in a branch delay slot, and the Debug Branch Delay (DBD) bit in the Debug register is set.

For asynchronous debug exceptions (debug interrupt, complex break), the DEPC contains the virtual address of the instruction where execution should resume after the debug handler code is executed.

No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10.5 Error Exception Program Counter (ErrorEPC – CP0 Register 30, Select 0)

This register is a read/write register, similar to the EPC register, except that it is used on error exceptions. All bits of the ErrorEPC are significant and must be writable. It is also used to store the program counter on Reset, Soft Reset, and non-maskable interrupt (NMI) exceptions. The ErrorEPC register contains the virtual address at which instruction processing can resume after servicing an error. This address can be:
• The virtual address of the instruction that caused the exception, or
• The virtual address of the immediately preceding branch or jump instruction when the error causing instruction is a branch delay slot.

Unlike the EPC register, there is no corresponding branch delay slot indication for the ErrorEPC register.

No initialization is performed on this register in the PIC32MX startup code.

5.7.2.10.6 Debug Exception Save Register (DeSave – CP0 Register 31, Select 0)

This register is a read/write register that functions as a simple memory location. This register is used by the debug exception handler to save on of the GPRs that is then used to save the rest of the context to a pre-determined memory area (such as in the EJTAG Probe). This register allows the safe debugging of exception handlers and other types of code where the existence of a valid stack for context saving cannot be assumed.

No initialization is performed on this register in the PIC32MX startup code.

5.7.2.11 CALL “ON BOOTSTRAP” PROCEDURE

A procedure is called after initializing the CP0 registers. This procedure allows users to perform actions during bootstrap (i.e., while StatusBEV is set) and before entering into the main routine. An empty weak version of this procedure (_on_bootstrap) is provided with the startup code. This procedure may be used for performing hardware initialization and/or for initializing the environment required by an RTOS.

5.7.2.12 CHANGE LOCATION OF EXCEPTION VECTORS

Immediately before calling the applications main routine, the StatusBEV is cleared to change the location of the exception vectors from the bootstrap location to the normal location.

5.7.2.13 CALL MAIN

The last thing that the startup code performs is a call to the main routine. If the user returns from main, the startup code goes into an infinite loop.
5.7.3 Exceptions

In addition, two weak general exception handlers are provided that can be overridden by the application—one to handle exceptions when StatusBEV is 1 (_bootstrap_exception_handler) and one to handle exceptions when StatusBEV is 0 (_general_exception_handler). Both the weak reset exception handler and the weak general exception handler provided with the startup code enters an infinite loop. The startup code arranges for a jump to the reset exception handler to be located at 0xBFC00380 and a jump to the general exception handler to be located at EBASE + 0x180.

Both handlers must be attributed with the nomips16 [e.g., __attribute__((nomips16))] since the startup code jumps to these functions.

FIGURE 5-10: EXCEPTIONS

![Diagram of memory layout with labels for different sections: Program Flash Memory (PFM) and Data RAM Memory (DRM). The diagram shows the locations of various sections such as .app_expt, .text, .noldata, .data, .data2, .data3, .data4, .got, .rel, .text, .lib, .lib2, .lib3, .lib4, .ramfun, .ramfun2, .ramfun3, .ramfun4, and the heap and stack sections.]}
5.7.4 Symbols Required by Startup Code and C Library

This section details the symbols that are required by the startup code and C library. Currently the default linker script defines these symbols. If an application provides a custom linker script, the user must ensure that all of the following symbols are provided in order for the startup code and C library to function:

<table>
<thead>
<tr>
<th>Symbol Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_bmxdkpba_address</td>
<td>The address to place into the BMXDKPBA register if _ramfunc_length is greater than 0.</td>
</tr>
<tr>
<td>_bmxdudba_address</td>
<td>The address to place into the BMXDUDBA register if _ramfunc_length is greater than 0.</td>
</tr>
<tr>
<td>_bmxdupba_address</td>
<td>The address to place into the BMXDUPBA register if _ramfunc_length is greater than 0.</td>
</tr>
<tr>
<td>_bss_begin</td>
<td>The starting location of the uninitialized data. Uninitialized data includes both .sbss and .bss.</td>
</tr>
<tr>
<td>_bss_end</td>
<td>The end location of the uninitialized data. Uninitialized data includes both .sbss and .bss.</td>
</tr>
<tr>
<td>_data_begin</td>
<td>The starting location of the initialized data. Initialized data includes .data, .got, .sdata, .lit8, and .lit4.</td>
</tr>
<tr>
<td>_data_end</td>
<td>The end location of the initialized data. Initialized data includes .data, .got, .sdata, .lit8, and .lit4.</td>
</tr>
<tr>
<td>_data_image_begin</td>
<td>The starting location in program memory of the image of initialized data. Initialized data includes .data, .got, .sdata, .lit8, and .lit4.</td>
</tr>
<tr>
<td>_ebase_address</td>
<td>The location of EBASE.</td>
</tr>
<tr>
<td>_end</td>
<td>The end of data allocation. Should be identical to _heap.</td>
</tr>
<tr>
<td>_gp</td>
<td>Points to the &quot;middle&quot; of the small variables region. By convention this is 0x8000 bytes from the first location used for small variables.</td>
</tr>
<tr>
<td>_heap</td>
<td>The starting location of the heap in DRM.</td>
</tr>
<tr>
<td>_ramfunc_begin</td>
<td>The starting location of the RAM functions. This should be located at a 2K boundary as it is used to initialize the BMXDPBA register.</td>
</tr>
<tr>
<td>_ramfunc_end</td>
<td>The end location of the RAM functions.</td>
</tr>
<tr>
<td>_ramfunc_image_begin</td>
<td>The starting location in program memory of the image of RAM functions.</td>
</tr>
<tr>
<td>_ramfunc_length</td>
<td>The length of the .ramfunc section.</td>
</tr>
<tr>
<td>_stack</td>
<td>The starting location of the stack in DRM. Remember that the stack grows from the bottom of data memory so this symbol should point to the bottom of the section allocated for the stack.</td>
</tr>
<tr>
<td>_vector_spacing</td>
<td>The initialization value for the vector spacing field in the IntCtl register.</td>
</tr>
</tbody>
</table>

5.8 CONTENTS OF THE DEFAULT LINKER SCRIPT

The default linker script contains the following categories of information:

- Output Format and Entry Points
- Default Values for Minimum Stack and Heap Sizes
- Processor Definitions Include File
- Inclusion of Processor-Specific Object File(s)
- Base Exception Vector Address and Vector Spacing Symbols
- Memory Address Equates
- Memory Regions
- Configuration Words Input/Output Section Map
- Input/Output Section Map

Note: All addresses specified in the linker scripts should be specified as virtual not physical addresses.

5.8.1 Output Format and Entry Points

The first several lines of the default linker script define the output format and the entry point for the application. Copies of the default linker scripts are provided in C:\program files\...\MPLAB C32\pic32mx\lib\ldscripts.

OUTPUT_FORMAT("elf32-tradlittlemips")
OUTPUT_ARCH(pic32mx)
ENTRY(_reset)

The OUTPUT_FORMAT line selects the object file format for the output file. The output object file format generated by the MPLAB C32 language tools is a traditional, little-endian, MIPS, ELF32 format.

The OUTPUT_ARCH line selects the specific machine architecture for the output file. The output files generated by the MPLAB C32 language tools contains information that identifies the file was generated for the PIC32MX architecture.

The ENTRY line selects the entry point of the application. This is the symbol identifying the location of the first instruction to execute. The MPLAB C32 language tools begins execution at the instruction identified by the _reset label.

5.8.2 Default Values for Minimum Stack and Heap Sizes

The next section of the default linker script provides default values for the minimum stack and heap sizes.

/*
 * Provide for a minimum stack and heap size
 * - _min_stack_size - represents the minimum space that must
 * be made available for the stack. Can be overridden from the command line
 * using the linker's --defsym option.
 * - _min_heap_size - represents the minimum space that must
 * be made available for the heap. Can be overridden from the command line
 * using the linker's --defsym option.
 */
EXTERN (_min_stack_size _min_heap_size)
PROVIDE(_min_stack_size = 0x400) ;
PROVIDE(_min_heap_size = 0) ;

The EXTERN line ensures that the rest of the linker script has access to the default values of _min_stack_size and _min_heap_size assuming that the user does not override these values using the linker's --defsym command line option.

The two PROVIDE lines ensure that a default value is provided for both _min_stack_size and _min_heap_size. The default value for the minimum stack size is 1024 bytes (0x400). The default value for the minimum heap size is 0 bytes.
5.8.3 Processor Definitions Include File

The next line in the default linker script pulls in information specific to the processor.

```
INCLUDE procdefs.ld
```

The file `procdefs.ld` is included in the linker script at this point. The file is searched for in the current directory and in any directory specified with the `-L` command line option. The compiler shell ensures that the correct directory is passed to the linker with the `-L` command line option based on the processor selected with the `-mprocessor` command line option.

The processor definitions linker script contains the following pieces of information:

- Inclusion of Processor-Specific Object File(s)
- Base Exception Vector Address and Vector Spacing Symbols
- Memory Address Equates
- Memory Regions
- Configuration Words Input/Output Section Map

5.8.3.1 INCLUSION OF PROCESSOR-SPECIFIC OBJECT FILE(S)

This section of the processor definitions linker script ensures that the processor-specific object file(s) get included in the link.

```
/*************************************************************/
/* Processor-specific object file. Contains SFR definitions. */
/*************************************************************/
INPUT("processor.o")
```

The `INPUT` line specifies that `processor.o` should be included in the link as if this file were named on the command line. The linker attempts to find this file in the current directory. If it is not found, the linker searches through the library search paths (i.e., the paths specified with the `-L` command line option).

5.8.3.2 BASE EXCEPTION VECTOR ADDRESS AND VECTOR SPACING SYMBOLS

This section of the processor definitions linker script defines values for the base exception vector address and vector spacing.

```
/** For interrupt vector handling
 **************************************************************/
 VECTOR_SPACING= 0x00000001;
 _ebase_address= 0x9FC01000;
```

The first line defines a value of 1 for `VECTOR_SPACING`. The available memory for exceptions only supports a vector spacing of 1. The second line defines the location of the base exception vector address (EBASE). This address is located in the KSEG0 boot segment.

5.8.3.3 MEMORY ADDRESS EQUATES

This section of the processor definitions linker script provides information about certain memory addresses required by the default linker script.

```
/** Memory Address Equates
 **************************************************************/
 RESET_ADDR= 0xBFC00000;
 BEV_EXCPT_ADDR= 0xBFC00380;
 DBG_EXCPT_ADDR= 0xBFC00480;
 DBG_CODE_ADDR= 0xBFC02000;
 GEN_EXCPT_ADDR= _ebase_address + 0x180;
```
The \_RESET_ADDR defines the processor’s reset address. This is the virtual begin address of the IFM Boot section in Kernel mode.

The \_BEV_EXCPT_ADDR defines the address that the processor jumps to when an exception is encountered and \text{Status}_{BEV} = 1.

The \_DBG_EXCPT_ADDR defines the address that the processor jumps to when a debug exception is encountered.

The \_DBG_CODE_ADDR defines the address that the start address of the debug executive.

The \_GEN_EXCPT_ADDR defines the address that the processor jumps to when an exception is encountered and \text{Status}_{BEV} = 0.

5.8.3.4 MEMORY REGIONS

This section of the processor definitions linker script provides information about the memory regions that are available on the device.

/****************************
* Memory Regions
* Memory regions without attributes cannot be used for
* orphaned sections. Only sections specifically assigned to
* these regions can be allocated into these regions.
****************************/

MEMORY
{
  kseg0_program_mem (rx) : ORIGIN = 0x9D000000, LENGTH = 0x8000
  kseg0_boot_mem : ORIGIN = 0x9FC00490, LENGTH = 0x970
  exception_mem : ORIGIN = 0x9FC01000, LENGTH = 0x1000
  kseg1_boot_mem : ORIGIN = 0xBFC00000, LENGTH = 0x490
  debug_exec_mem : ORIGIN = 0xBFC02000, LENGTH = 0xFF0
  config3 : ORIGIN = 0xBFC02FF0, LENGTH = 0x4
  config2 : ORIGIN = 0xBFC02FF4, LENGTH = 0x4
  config1 : ORIGIN = 0xBFC02FF8, LENGTH = 0x4
  config0 : ORIGIN = 0xBFC02FFC, LENGTH = 0x4
  kseg1_data_mem (w!x) : ORIGIN = 0xA0000000, LENGTH = 0x2000
  sfrs : ORIGIN = 0xBF800000, LENGTH = 0x10000
}

Eleven memory regions are defined with an associated start address and length:

1. Program memory region (kseg0_program_mem) for application code
2. Boot memory regions (kseg0_boot_mem and kseg1_boot_mem)
3. Exception memory region (exception_mem)
4. Debug executive memory region (debug_exec_mem)
5. Configuration memory regions (config3, config2, config1, and config0)
6. Data memory region (kseg1_data_mem)
7. SFR memory region (sfrs)

The default linker script uses these names to locate sections into the correct regions. Sections which are non-standard become orphaned sections. The attributes of the memory regions are used to locate these orphaned sections. The attributes (\text{rx}) specify that read-only sections or executable sections can be located into the program memory regions. Similarly, the attributes (\text{w!x}) specify that sections that are not read-only and not executable can be located in the data memory region. Since no attributes are specified for the boot memory region, the configuration memory regions, or the SFR memory region, only specified sections may be located in these regions...
(i.e., orphaned sections may not be located in the boot memory regions, the exception
memory region, the configuration memory regions, the debug executive memory
region, or the SFR memory region).

5.8.3.5 CONFIGURATION WORDS INPUT/OUTPUT SECTION MAP

The last section in the processor definitions linker script is the input/output section map
for configuration words. This section map is additive to the Input/Output Section Map
found in the default linker script (see Section 5.8.4 “Input/Output Section Map”). It
defines how input sections for configuration words are mapped to output sections for
configuration words. Note that input sections are portions of an application that are
defined in source code, while output sections are created by the linker. Generally,
several input sections may be combined into a single output section. All output sections
are specified within a SECTIONS command in the linker script.

For each configuration word that exists on the specific processor, a distinct output
section named .config_address exists where address is the location of the
configuration word in memory. Each of these sections contains the data created by the
#pragma config directive (see Section 4.8.1 “#pragma config”) for that
configuration word. Each section is assigned to their respective memory region
(confign).

5.8.4 Input/Output Section Map

The last section in the default linker script is the input/output section map. The section
map is the heart of the linker script. It defines how input sections are mapped to output
sections. Note that input sections are portions of an application that are defined in
source code, while output sections are created by the linker. Generally, several input
sections may be combined into a single output section. All output sections are specified
within a SECTIONS command in the linker script.

The following output sections may be created by the linker:

• .reset Section
• .bevExcept Section
• .dbgExcept Section
• .dbg_code Section
• .appExcept Section
• .vector_0 .. .vector_63 Sections
• .startup Section
• .text Section
• .rodata Sectionn
• .sdata2 Section
• .sbss2 Section
• .dbg_data Section
• .data Section
• .got Section
• .sdata Section
• .lit8 Section
• .lit4 Section
• .sbss Section
• .bss Section
• .heap Section
• .stack Section
• .ramfunc Section
• Stack Location
• Debug Sections

5.8.4.1 .RESET SECTION

This section contains the code that is executed when the processor performs a reset. This section is located at the reset address (_RESET_ADDR) as specified in the processor definitions linker script and is assigned to the boot memory region (kseg1_boot_mem).

```assembly
.reset _RESET_ADDR :
{
  *(.reset)
} > kseg1_boot_mem
```

5.8.4.2 .BEV_EXCPT SECTION

This section contains the handler for exceptions that occur when StatusBEV = 1. This section is located at the BEV exception address (_BEV_EXCPT_ADDR) as specified in the processor definitions linker script and is assigned to the boot memory region (kseg1_boot_mem).

```assembly
.bev_excpt _BEV_EXCPT_ADDR :
{
  *(.bev_handler)
} > kseg1_boot_mem
```

5.8.4.3 .DBG_EXCPT SECTION

This section reserves space for the debug exception vector. This section is only allocated if the symbol _DEBUGGER has been defined. (This symbol is defined if the -mdebugger command line option is specified to the shell.) This section is located at the debug exception address (_DBG_EXCPT_ADDR) as specified in the processor definitions linker script and is assigned to the boot memory region (kseg1_boot_mem). The section is marked as NOLOAD as it is only intended to ensure that application code cannot be placed at locations reserved for the debug executive.

```assembly
.dbg_excpt _DBG_EXCPT_ADDR (NOLOAD) :
{
  . += (DEFINED (_DEBUGGER) ? 0x8 : 0x0);
} > kseg1_boot_mem
```
5.8.4.4 .DBG_CODE SECTION

This section reserves space for the debug exception handler. This section is only allocated if the symbol _DEBUGGER has been defined. (This symbol is defined if the -mdebugger command line option is specified to the shell.) This section is located at the debug code address (_DBG_CODE_ADDR) as specified in the processor definitions linker script and is assigned to the debug executive memory region (debug_exec_mem). The section is marked as NOLOAD as it is only intended to ensure that application code cannot be placed at locations reserved for the debug executive.

.dbg_code _DBG_CODE_ADDR (NOLOAD) :
{
  . += (DEFINED (_DEBUGGER) ? 0xFF0 : 0x0);
} > debug_exec_mem

5.8.4.5 .APP_EXCPT SECTION

This section contains the handler for exceptions that occur when StatusBEV = 0. This section is located at the general exception address (_GEN_EXCPT_ADDR) as specified in the processor definitions linker script and is assigned to the exception memory region (exception_mem).

.app_excpt _GEN_EXCPT_ADDR :
{
  *(.gen_handler)
} > exception_mem

5.8.4.6 .VECTOR_0 .. .VECTOR_63 SECTIONS

These sections contain the handler for each of the interrupt vectors. These sections are located at the correct vectored addresses using the formula:

_ebase_address + 0x200 + (_vector_spacing << 5) * n

where n is the respective vector number.

Each of the sections is followed by an assert that ensures the code located at the vector does not exceed the vector spacing specified.

.vector_n _ebase_address + 0x200 + (_vector_spacing << 5) * n :
{
  *(.vector_n)
} > exception_mem

ASSERT (SIZEOF(.vector_n) < (_vector_spacing << 5), "function at exception vector n too large")

5.8.4.7 .STARTUP SECTION

This section contains the C startup code. This section is assigned to the KSEG0 boot memory region (kseg0_boot_mem).

.startup ORIGIN(kseg0_boot_mem) :
{
  *(.startup)
} > kseg0_boot_mem

5.8.4.8 .TEXT SECTION

This section collects executable code from all of the application’s input files. This section is assigned to the program memory region (kseg0_program_mem) and has a fill value of NOP (0). Symbols are defined to represent the begin (_text_begin) and end (_text_end) addresses of this section.

.text ORIGIN(kseg0_program_mem) :
{
  _text_begin = . ;
5.8.4.9 .RODATA SECTION

This section collects the read-only sections from all of the application's input files. This section is assigned to the program memory region (kseg0_program_mem).

```assembly
.rodata :
{
  *(.rodata .rodata.* .gnu.linkonce.r.*)
  *(.rodata1)
} > kseg0_program_mem
```

5.8.4.10 .SDATA2 SECTION

This section collects the small initialized constant global and static data from all of the application's input files. Because of the constant nature of the data, this section is also a read-only section. This section is assigned to the program memory region (kseg0_program_mem).

```assembly
/*
 * Small initialized constant global and static data can be placed in the .sdata2 section. This is different from .sdata, which contains small initialized non-constant global and static data.
 */
.sdata2 :
{
  *(.sdata2 .sdata2.* .gnu.linkonce.s2.*)
} > kseg0_program_mem
```

5.8.4.11 .SBSS2 SECTION

This section collects the small uninitialized constant global and static data from all of the application's input files. Because of the constant nature of the data, this section is also a read-only section. This section is assigned to the program memory region (kseg0_program_mem).

```assembly
/*
 * Uninitialized constant global and static data (i.e., variables which will always be zero). Again, this is different from .sbss, which contains small non-initialized, non-constant global and static data.
 */
.sbss2 :
{
  *(.sbss2 .sbss2.* .gnu.linkonce.sb2.*)
} > kseg0_program_mem
```

5.8.4.12 .DBG_DATA SECTION

This section reserves space for the data required by the debug exception handler. This section is only allocated if the symbol _DEBUGGER has been defined. (This symbol is defined if the -mdebugger command line option is specified to the shell.) This section is assigned to the data memory region (kseg1_data_mem). The section is marked as NOLOAD as it is only intended to ensure that application data cannot be placed at locations reserved for the debug executive.
.dbg_data (NOLOAD) :
{
   . += (DEFINED (_DEBUGGER) ? 0x200 : 0x0);
} > kseg1_data_mem

5.8.4.13 .DATA SECTION

This section collects the initialized data from all of the application's input files. This section is assigned to the data memory region (kseg1_data_mem) with a load address located in the program memory region (kseg0_program_mem). Symbols are defined to represent the virtual begin (_data_begin) and end (_data_end) addresses of this section, as well as the physical begin address of the data in program memory (_data_image_begin).

.data :
{
   _data_begin = . ;
   *(.data .data.* .gnu.linkonce.d.*)
   KEEP (*(.gnu.linkonce.d.*personality*))
   *(.data1)
} > kseg1_data_mem AT> kseg0_program_mem
_data_image_begin = LOADADDR(.data) ;

5.8.4.14 .GOT SECTION

This section collects the global offset table from all of the application's input files. This section is assigned to the data memory region (kseg1_data_mem) with a load address located in the program memory region (kseg0_program_mem). A symbol is defined to represent the location of the global pointer (_gp).

_gp = ALIGN(16) + 0x7FF0 ;
.got :
{
   *(.got.plt) *(.got)
} > kseg1_data_mem AT> kseg0_program_mem

5.8.4.15 .SDATA SECTION

This section collects the small initialized data from all of the application's input files. This section is assigned to the data memory region (kseg1_data_mem) with a load address located in the program memory region (kseg0_program_mem). Symbols are defined to represent the virtual begin (_sdata_begin) and end (_sdata_end) addresses of this section.

/*
 * We want the small data sections together, so
 * single-instruction offsets can access them all, and
 * initialized data all before uninitialized, so
 * we can shorten the on-disk segment size.
 */
.sdata :
{
   _sdata_begin = . ;
   *(.sdata .sdata.* .gnu.linkonce.s.*)
   _sdata_end = . ;
} > kseg1_data_mem AT> kseg0_program_mem
5.8.4.16 .LIT8 SECTION

This section collects the 8-byte constants (usually floating-point) which the assembler
decides to store in memory rather than in the instruction stream from all of the
application's input files. This section is assigned to the data memory region
(kseg1_data_mem) with a load address located in the program memory region
(kseg0_program_mem).

.lit8
{ *
} > kseg1_data_mem AT> kseg0_program_mem

5.8.4.17 .LIT4 SECTION

This section collects the 4-byte constants (usually floating-point) which the assembler
decides to store in memory rather than in the instruction stream from all of the
application's input files. This section is assigned to the data memory region
(kseg1_data_mem) with a load address located in the program memory region
(kseg0_program_mem). A symbol is defined to represent the virtual end address of
the initialized data (_data_end).

.lit4
{ *
} > kseg1_data_mem AT> kseg0_program_mem

_data_end = . ;

5.8.4.18 .SBSS SECTION

This section collects the small uninitialized data from all of the application's input files.
This section is assigned to the data memory region (kseg1_data_mem). A symbol is
defined to represent the virtual begin address of uninitialized data (_bss_begin). Symbols are also defined to represent the virtual begin (_sbss_begin) and end
(_sbss_end) addresses of this section.

_bss_begin = . ;
.sbss :
{ _sbss_begin = . ;
  *(dynsbss)
  *(.sbss .sbss.* .gnu.linkonce.sb.*)
  *(.scommon)
  _sbss_end = . ;
} > kseg1_data_mem

5.8.4.19 .BSS SECTION

This section collects the uninitialized data from all of the application's input files. This
section is assigned to the data memory region (kseg1_data_mem). A symbol is
defined to represent the virtual end address of uninitialized data (_bss_end). A symbol
is also defined to represent the virtual end address of data memory (_end).

.bss :
{ *(dynbss)
  *(.bss .bss.* .gnu.linkonce.b.*)
  *(COMMON)
  /*
   * Align here to ensure that the .bss section occupies
   * space up to _end. Align after .bss to ensure correct
   * alignment even if the .bss section disappears because
   * there are no input sections. 

5.8.4.20 .HEAP SECTION

This section reserves space for the heap, which is required for dynamic memory allocation. A symbol is defined to represent the virtual address of the heap (_heap). The minimum amount of space reserved for the heap is determined by the symbol _min_heap_size.

/* Heap allocating takes a chunk of memory following BSS */
.heap ALIGN(4) :
{
    _heap = . ;
    . += _min_heap_size ;
} > kseg1_data_mem

5.8.4.21 .STACK SECTION

This section reserves space for the stack. The minimum amount of space reserved for the stack is determined by the symbol _min_stack_size.

/* Stack allocation follows the heap */
.stack ALIGN(4) :
{
    . += _min_stack_size ;
} > kseg1_data_mem

5.8.4.22 .RAMFUNC SECTION

This section collects the RAM functions from all of the application’s input files. This section is assigned to the data memory region (kseg1_data_mem) with a load address located in the program memory region (kseg0_program_mem). Symbols are defined to represent the virtual begin (_ramfunc_begin) and end (_ramfunc_end) addresses of this section, as well as the physical begin address of the RAM functions in program memory (_ramfunc_image_begin) and a length of the RAM functions (_ramfunc_length). In addition, the addresses for the bus matrix registers are calculated (_bmxdkpba_address, _bmxduda_address, and _bmxdupba_address).

/*
* RAM functions go at the end of our stack and heap allocation.
* Alignment of 2K required by the boundary register (BMXDKPBA).
*/
.ramfunc ALIGN(2K) :
{
    _ramfunc_begin = . ;
    *(.ramfunc .ramfunc.*)
    . = ALIGN(4) ;
    _ramfunc_end = . ;
} > kseg1_data_mem AT> kseg0_program_mem
_ramfunc_image_begin = LOADADDR(.ramfunc) ;
_ramfunc_length = SIZEOF(.ramfunc) ;
_bmxdkpba_address = _ramfunc_begin - ORIGIN(kseg1_data_mem) ;
_bmxduda_address = LENGTH(kseg1_data_mem) ;
_bmxdupba_address = LENGTH(kseg1_data_mem) ;
5.8.4.23 STACK LOCATION

A symbol is defined to represent the location of the Stack Pointer (_stack). This location is dependent on whether RAM functions exist in the application. If RAM functions exist, then the location of the Stack Pointer should include the gap between the stack section and the beginning of the .ramfunc section caused by the alignment of the .ramfunc section minus one word. If RAM functions do not exist, then the location of the Stack Pointer should be the end of the KSEG1 data memory.

/*
 * The actual top of stack should include the gap between
 * the stack section and the beginning of the .ramfunc
 * section caused by the alignment of the .ramfunc section
 * minus 1 word. If RAM functions do not exist, then the top
 * of the stack should point to the end of the kseg1 data
 * memory.
 */
_stack = (_ramfunc_length > 0)
  ? _ramfunc_begin - 4
  : ORIGIN(kseg1_data_mem) + LENGTH(kseg1_data_mem);
ASSERT((_min_stack_size + _min_heap_size) <= (_stack - _heap),
  "Not enough space to allocate both stack and heap. Reduce heap
and/or stack size.")

5.8.4.24 DEBUG SECTIONS

The debug sections contain debugging information. They are not loaded into program flash.

/* Stabs debugging sections. */
.stab 0 : { *(.stab) }
.stabstr 0 : { *(.stabstr) }
.stab.excl 0 : { *(.stab.excl) }
.stab.exclstr 0 : { *(.stab.exclstr) }
.stab.index 0 : { *(.stab.index) }
.stab.indexstr 0 : { *(.stab.indexstr) }
.comment 0 : { *(.comment) }
/* DWARF debug sections. Symbols in the DWARF debugging sections are relative
to the beginning of the section so we begin them at 0. */
/* DWARF 1 */
.debug 0 : { *(.debug) }
.line 0 : { *(.line) }
/* GNU DWARF 1 extensions */
.debug_srcinfo 0 : { *(.debug_srcinfo) }
.debug_sfnames 0 : { *(.debug_sfnames) }
/* DWARF 1.1 and DWARF 2 */
.debug_aranges 0 : { *(.debug_aranges) }
.debug_pubnames 0 : { *(.debug_pubnames) }
/* DWARF 2 */
.debug_info 0 : { *(.debug_info .gnu.linkonce.wi.*) }
.debug_abbrev 0 : { *(.debug_abbrev) }
.debug_line 0 : { *(.debug_line) }
.debug_frame 0 : { *(.debug_frame) }
.debug_str 0 : { *(.debug_str) }
.debug_loc 0 : { *(.debug_loc) }
.debug_macinfo 0 : { *(.debug_macinfo) }
/* SGI/MIPS DWARF 2 extensions */
.debug_weaknames 0 : { *(.debug_weaknames) }
.debug_funcnames 0 : { *(.debug_funcnames) }
5.9 RAM FUNCTIONS

Functions may be located in RAM to improve performance. The __ramfunc__ and __longramfunc__ specifiers are used on a function declaration to specify that the function will be executed out of RAM.

Functions specified as a RAM function will be copied to RAM by the startup code and all calls to those functions will reference the RAM location. Functions located in RAM will be in a different 512MB memory segment than functions located in program memory, so the longcall attribute should be applied to any RAM function which will be called from a function not in RAM. The __longramfunc__ specifier will apply the longcall attribute as well as place the function in RAM¹.

/* function ‘foo’ will be placed in RAM */
void __ramfunc__ foo (void)
{
}

/* function ‘bar’ will be placed in RAM and will be invoked using the full 32 bit address */
void __longramfunc__ bar (void)
{
}

¹ Specifying __longramfunc__ is functionally equivalent to specifying both __ramfunc__ and __longcall__.
Appendix A. Implementation Defined Behavior

A.1 INTRODUCTION

This chapter discusses the choices for implementation defined behavior in MPLAB C32 C compiler.

A.2 HIGHLIGHTS

Items discussed in this chapter are:

• Overview
• Translation
• Environment
• Identifiers
• Characters
• Integers
• Floating-Point
• Arrays and Pointers
• Hints
• Structures, Unions, Enumerations, and Bit-fields
• Qualifiers
• Declarators
• Statements
• Pre-Processing Directives
• Library Functions
• Architecture

A.3 OVERVIEW

ISO C requires a conforming implementation to document the choices for behaviors defined in the standard as "implementation-defined." The following sections list all such areas, the choices made for MPLAB C32 C compiler, and the corresponding section number from the ISO/IEC 9899:1999 standard.

A.4 TRANSLATION

<table>
<thead>
<tr>
<th>ISO Standard</th>
<th>Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;How a diagnostic is identified (3.10, 5.1.1.3).&quot;</td>
<td>All output to stderr is a diagnostic.</td>
</tr>
<tr>
<td>&quot;Whether each nonempty sequence of white-space characters other than new-line is retained or replaced by one space character in translation phase 3 (5.1.1.2).&quot;</td>
<td>Each sequence of whitespace is replaced by a single character.</td>
</tr>
</tbody>
</table>
A.5 ENVIRONMENT

ISO Standard: “The name and type of the function called at program startup in a freestanding environment (5.1.2.1).”

Implementation: int main (void);

ISO Standard: “The effect of program termination in a freestanding environment (5.1.2.1).”

Implementation: An infinite loop (branch to self) instruction will be execute.

ISO Standard: “An alternative manner in which the main function may be defined (5.1.2.2.1).”

Implementation: int main (void);

ISO Standard: “The values given to the strings pointed to by the argv argument to main (5.1.2.2.1).”

Implementation: No arguments are passed to main. Reference to argc or argv is undefined.

ISO Standard: “What constitutes an interactive device (5.1.2.3).”

Implementation: Application defined.

ISO Standard: “Signals for which the equivalent of signal(sig, SIG_IGN); is executed at program startup (7.14.1.1).”

Implementation: Signals are application defined.

ISO Standard: “The form of the status returned to the host environment to indicate unsuccessful termination when the SIGABRT signal is raised and not caught (7.20.4.1).”

Implementation: The host environment is application defined.

ISO Standard: “The forms of the status returned to the host environment by the exit function to report successful and unsuccessful termination (7.20.4.3).”

Implementation: The host environment is application defined.

ISO Standard: “The status returned to the host environment by the exit function if the value of its argument is other than zero, EXIT_SUCCESS, or EXIT_FAILURE (7.20.4.3).”

Implementation: The host environment is application defined.

ISO Standard: “The set of environment names and the method for altering the environment list used by the getenv function (7.20.4.4).”

Implementation: The host environment is application defined.
Implementation Defined Behavior

ISO Standard: “The manner of execution of the string by the system function (7.20.4.5).”

Implementation: The host environment is application defined.

A.6 IDENTIFIERS

ISO Standard: “Which additional multibyte characters may appear in identifiers and their correspondence to universal character names (6.4.2).”

Implementation: No.

ISO Standard: “The number of significant initial characters in an identifier (5.2.4.1, 6.4.2).”

Implementation: All characters are significant.

A.7 CHARACTERS

ISO Standard: “The number of bits in a byte (C90 3.4, C99 3.6).”

Implementation: 8.

ISO Standard: “The values of the members of the execution character set (C90 and C99 5.2.1).”

ISO Standard: “The unique value of the member of the execution character set produced for each of the standard alphabetic escape sequences (C90 and C99 5.2.2).”

Implementation: The execution character set is ASCII.

ISO Standard: “The value of a char object into which has been stored any character other than a member of the basic execution character set (C90 6.1.2.5, C99 6.2.5).”

Implementation: The value of the char object is the 8 bit binary representation of the character in the source character set. That is, no translation is done.

ISO Standard: “Which of signed char or unsigned char has the same range, representation, and behavior as “plain” char (C90 6.1.2.5, C90 6.2.1.1, C99 6.2.5, C99 6.3.1.1).”

Implementation: By default, signed char is functionally equivalent to plain char. The options -funsigned-char and -fsigned-char can be used to change the default.

ISO Standard: “The mapping of members of the source character set (in character constants and string literals) to members of the execution character set (C90 6.1.3.4, C99 6.4.4.4, C90 and C99 5.1.1.2).”

Implementation: The binary representation of the source character set is preserved to the execution character set.
ISO Standard:  “The value of an integer character constant containing more than one character or containing a character or escape sequence that does not map to a single-byte execution character (C90 6.1.3.4, C99 6.4.4.4).”

Implementation:  The compiler determines the value for a multi-character character constant one character at a time. The previous value is shifted left by eight, and the bit pattern of the next character is masked in. The final result is of type int. If the result is larger than can be represented by an int, a warning diagnostic is issued and the value truncated to int size.

ISO Standard:  “The value of a wide character constant containing more than one multibyte character, or containing a multibyte character or escape sequence not represented in the extended execution character set (C90 6.1.3.4, C99 6.4.4.4).”

Implementation:  See previous.

ISO Standard:  “The current locale used to convert a wide character constant consisting of a single multibYTE character that maps to a member of the extended execution character set into a corresponding wide character code (C90 6.1.3.4, C99 6.4.4.4).”

Implementation:  LC_ALL

ISO Standard:  “The current locale used to convert a wide string literal into corresponding wide character codes (C90 6.1.4, C99 6.4.5).”

Implementation:  LC_ALL

ISO Standard:  “The value of a string literal containing a multibYTE character or escape sequence not represented in the execution character set (C90 6.1.4, C99 6.4.5).”

Implementation:  The binary representation of the characters is preserved from the source character set.

A.8 INTEGERS

ISO Standard:  “Any extended integer types that exist in the implementation (C99 6.2.5).”

Implementation:  There are no extended integer types.

ISO Standard:  “Whether signed integer types are represented using sign and magnitude, two's complement, or one's complement, and whether the extraordinary value is a trap representation or an ordinary value (C99 6.2.6.2).”

Implementation:  All integer types are represented as two’s complement, and all bit patterns are ordinary values.

ISO Standard:  “The rank of any extended integer type relative to another extended integer type with the same precision (C99 6.3.1.1).”
Implementation Defined Behavior

| Implementation: | No extended integer types are supported. |
| ISO Standard:   | “The result of, or the signal raised by, converting an integer to a signed integer type when the value cannot be represented in an object of that type (C90 6.2.1.2, C99 6.3.1.3).” |
| Implementation: | When converting value X to a type of width N, the value of the result is the least significant N bits of the 2’s complement representation of X. That is, X is truncated to N bits. No signal is raised. |
| ISO Standard:   | “The results of some bitwise operations on signed integers (C90 6.3, C99 6.5).” |
| Implementation: | Bitwise operations on signed values act on the 2’s complement representation, including the sign bit. The result of a signed right shift expression is sign extended. |
| ISO Standard:   | C99 allows some aspects of signed ‘<<‘ to be undefined. MPLAB C32 C compiler does not do so. |

A.9 FLOATING-POINT

| ISO Standard: | “The accuracy of the floating-point operations and of the library functions in <math.h> and <complex.h> that return floating-point results (C90 and C99 5.2.4.2.2).” |
| Implementation: | The accuracy is unknown. |
| ISO Standard: | “The accuracy of the conversions between floating-point internal representations and string representations performed by the library functions in <stdio.h>, <stdlib.h>, and <wchar.h> (C90 and C99 5.2.4.2.2).” |
| Implementation: | The accuracy is unknown. |
| ISO Standard: | “The rounding behaviors characterized by non-standard values of FLT_ROUNDS (C90 and C99 5.2.4.2.2).” |
| Implementation: | No such values are used. |
| ISO Standard: | “The evaluation methods characterized by non-standard negative values of FLT_EVAL_METHOD (C90 and C99 5.2.4.2.2).” |
| Implementation: | No such values are used. |
| ISO Standard: | “The direction of rounding when an integer is converted to a floating-point number that cannot exactly represent the original value (C90 6.2.1.3, C99 6.3.1.4).” |
| Implementation: | C99 Annex F is followed. |
| ISO Standard: | “The direction of rounding when a floating-point number is converted to a narrower floating-point number (C90 6.2.1.4, 6.3.1.5).” |
Implementation: C99 Annex F is followed.

ISO Standard: “How the nearest representable value or the larger or smaller
representable value immediately adjacent to the nearest
representable value is chosen for certain floating constants (C90
6.1.3.1, C99 6.4.4.2).”

Implementation: C99 Annex F is followed.

ISO Standard: “Whether and how floating expressions are contracted when not
disallowed by the FP_CONTRACT pragma (C99 6.5).”

Implementation: The pragma is not implemented.

ISO Standard: “The default state for the FENV_ACCESS pragma (C99 7.6.1).”

Implementation: This pragma is not implemented.

ISO Standard: “Additional floating-point exceptions, rounding modes,
environments, and classifications, and their macro names (C99
7.6, 7.12).”

Implementation: None supported.

ISO Standard: “The default state for the FP_CONTRACT pragma (C99 7.12.2).”

Implementation: This pragma is not implemented.

ISO Standard: “Whether the “inexact” floating-point exception can be raised
when the rounded result actually does equal the mathematical
result in an IEC 60559 conformant implementation (C99 F.9).”

Implementation: Unknown.

ISO Standard: “Whether the “underflow” (and “inexact”) floating-point exception
can be raised when a result is tiny but not inexact in an IEC 60559
conformant implementation (C99 F.9).”

Implementation: Unknown.

A.10 ARRAYS AND POINTERS

ISO Standard: “The result of converting a pointer to an integer or vice versa (C90
6.3.4, C99 6.3.2.3).”

Implementation: A cast from an integer to a pointer or vice versa results uses the
binary representation of the source type, reinterpreted as
appropriate for the destination type.

If the source type is larger than the destination type, the most
significant bits are discarded. When casting from a pointer to an
integer, if the source type is smaller than the destination type, the
result is sign extended. When casting from an integer to a pointer,
if the source type is smaller than the destination type, the result is
extended base don the signedness of the source type.
ISO Standard: “The size of the result of subtracting two pointers to elements of the same array (C90 6.3.6, C99 6.5.6).”
Implementation: 32 bit signed integer.

A.11 HINTS

ISO Standard: “The extent to which suggestions made by using the register storage-class specifier are effective (C90 6.5.1, C99 6.7.1).”
Implementation: The register storage class specifier generally has no effect.

ISO Standard: “The extent to which suggestions made by using the inline function specifier are effective (C99 6.7.4).”
Implementation: If -fno-inline or -O0 are specified, no functions will be inlined, even if specified with the inline specifier. Otherwise, the function may or may not be inlined dependent on the optimization heuristics of the compiler.

A.12 STRUCTURES, UNIONS, ENUMERATIONS, AND BIT-FIELDS

ISO Standard: “A member of a union object is accessed using a member of a different type (C90 6.3.2.3).”
Implementation: The corresponding bytes of the union object are interpreted as an object of the type of the member being accessed without regard for alignment or other possible invalid conditions.

ISO Standard: “Whether a “plain” int bit-field is treated as a signed int bit-field or as an unsigned int bit-field (C90 6.5.2, C90 6.5.2.1, C99 6.7.2, C99 6.7.2.1).”
Implementation: By default, a plain int bit-field is treated as a signed integer. This behavior can be altered by use of the -funsigned-bitfields command line option.

ISO Standard: “Allowable bit-field types other than _Bool, signed int, and unsigned int (C99 6.7.2.1).”
Implementation: No other types are supported.

ISO Standard: “Whether a bit-field can straddle a storage-unit boundary (C90 6.5.2.1, C99 6.7.2.1).”
Implementation: No.

ISO Standard: “The order of allocation of bit-fields within a unit (C90 6.5.2.1, C99 6.7.2.1).”
Implementation: Bit-fields are allocated left to right.

ISO Standard: “The alignment of non-bit-field members of structures (C90 6.5.2.1, C99 6.7.2.1).”
Implementation: Each member is located to the lowest available offset allowable according to the alignment restrictions of the member type.

ISO Standard: “The integer type compatible with each enumerated type (C90 6.5.2.2, C99 6.7.2.2).”

Implementation: If the enumeration values are all non-negative, the type is unsigned int, else it is int. The -fshort-enums command line option can change this.

A.13 QUALIFIERS

ISO Standard: “What constitutes an access to an object that has volatile-qualified type (C90 6.5.3, C99 6.7.3).”

Implementation: Any expression which uses the value of or stores a value to a volatile object is considered an access to that object. There is no guarantee that such an access is atomic.

If an expression contains a reference to a volatile object but neither uses the value nor stores to the object, the expression is considered an access to the volatile object or not depending on the type of the object. If the object is of scalar type, an aggregate type with a single member of scalar type, or a union with members of (only) scalar type, the expression is considered an access to the volatile object. Otherwise, the expression is evaluated for its side effects but is not considered an access to the volatile object.

For example,

```
volatile int a;

a; /* access to 'a' since 'a' is scalar */
```

A.14 DECLARATORS

ISO Standard: “The maximum number of declarators that may modify an arithmetic, structure or union type (C90 6.5.4).”

Implementation: No limit.

A.15 STATEMENTS

ISO Standard: “The maximum number of case values in a switch statement (C90 6.6.4.2).”

Implementation: No limit.

A.16 PRE-PROCESSING DIRECTIVES

ISO Standard: “How sequences in both forms of header names are mapped to headers or external source file names (C90 6.1.7, C99 6.4.7).”
Implementation Defined Behavior

**Implementation:** The character sequence between the delimiters is considered to be a string which is a file name for the host environment.

**ISO Standard:** “Whether the value of a character constant in a constant expression that controls conditional inclusion matches the value of the same character constant in the execution character set (C90 6.8.1, C99 6.10.1).”

**Implementation:** Yes.

**ISO Standard:** “Whether the value of a single-character character constant in a constant expression that controls conditional inclusion may have a negative value (C90 6.8.1, C99 6.10.1).”

**Implementation:** Yes.

**ISO Standard:** “The places that are searched for an included `< >` delimited header, and how the places are specified or the header is identified (C90 6.8.2, C99 6.10.2).”

**Implementation:** `<install directory>/lib/gcc/pic32mx/3.4.4/include`

`<install directory>/pic32mx/include`

**ISO Standard:** “How the named source file is searched for in an included " " delimited header (C90 6.8.2, C99 6.10.2).”

**Implementation:** The compiler first searches for the named file in the directory containing the including file, the directories specified by the `-iquote` command line option (if any), then the directories which are searched for a `< >` delimited header.

**ISO Standard:** “The method by which preprocessing tokens are combined into a header name (C90 6.8.2, C99 6.10.2).”

**Implementation:** All tokens, including whitespace, are considered part of the header file name. Macro expansion is not performed on tokens inside the delimiters.

**ISO Standard:** “The nesting limit for `#include` processing (C90 6.8.2, C99 6.10.2).”

**Implementation:** No limit.

**ISO Standard:** “The behavior on each recognized non-STDC `#pragma` directive (C90 6.8.6, C99 6.10.6).”

**Implementation:** See Section 1.7 “Attributes and Pragmas”.

**ISO Standard:** “The definitions for `__DATE__` and `__TIME__` when respectively, the date and time of translation are not available (C90 6.8.8, C99 6.10.8).”

**Implementation:** The date and time of translation are always available.
A.17 LIBRARY FUNCTIONS

ISO Standard: “The null pointer constant to which the macro NULL expands (C90 7.1.6, C99 7.17).”

Implementation: (void *)0

ISO Standard: “Any library facilities available to a freestanding program, other than the minimal set required by clause 4 (5.1.2.1).”

Implementation: See the “MPLAB C32 C Compiler Libraries” (DS51685).

ISO Standard: “The format of the diagnostic printed by the assert macro (7.2.1.1).”

Implementation: “Failed assertion ‘message’ at line line of ‘filename’.\n”

ISO Standard: “The default state for the FENV_ACCESS pragma (7.6.1).”

Implementation: Unimplemented.

ISO Standard: “The representation of floating point exception flags stored by the fegetexceptflag function (7.6.2.2).”

Implementation: Unimplemented.

ISO Standard: “Whether the feraiseexcept function raises the inexact exception in addition to the overflow or underflow exception (7.6.2.3).”

Implementation: Unimplemented.

ISO Standard: “Floating environment macros other than FE_DFL_ENV that can be used as the argument to the fesetenv or feupdateenv function (7.6.4.3, 7.6.4.4).”

Implementation: Unimplemented.

ISO Standard: “Strings other than “C” and “” that may be passed as the second argument to the setlocale function (7.11.1.1).”

Implementation: None.

ISO Standard: “The types defined for float_t and double_t when the value of the FLT_EVAL_METHOD macro is less than 0 or greater than 2 (7.12).”

Implementation: Unimplemented.

ISO Standard: “The infinity to which the INFINITY macro expands, if any (7.12).”

Implementation: Unimplemented.
ISO Standard: “The quiet NaN to which the `_NAN_` macro expands, when it is defined (7.12).”
Implementation: Unimplemented.

ISO Standard: “Domain errors for the mathematics functions, other than those required by this International Standard (7.12.1).”
Implementation: None.

ISO Standard: “The values returned by the mathematics functions, and whether `_errno_` is set to the value of the macro `_EDOM_` on domain errors (7.12.1).”
Implementation: `_errno_` is set to `_EDOM_` on domain errors.

ISO Standard: “Whether the mathematics functions set `_errno_` to the value of the macro `_ERANGE_` on overflow and/or underflow range errors (7.12.1).”
Implementation: Yes.

ISO Standard: “The default state for the `FP_CONTRACT` pragma (7.12.2)
Implementation: Unimplemented.

ISO Standard: “Whether a domain error occurs or zero is returned when the `fmod` function has a second argument of zero (7.12.10.1).”
Implementation: NaN is returned.

ISO Standard: “The base-2 logarithm of the modulus used by the `remquo` function in reducing the quotient (7.12.10.3).”
Implementation: Unimplemented.

ISO Standard: “The set of signals, their semantics, and their default handling (7.14).”
Implementation: The default handling of signals is to always return failure. Actual signal handling is application defined.

ISO Standard: “If the equivalent of `signal(sig, SIG_DFL);` is not executed prior to the call of a signal handler, the blocking of the signal that is performed (7.14.1.1).”
Implementation: Application defined.

ISO Standard: “Whether the equivalent of `signal(sig, SIG_DFL);` is executed prior to the call of a signal handler for the signal `SIGILL` (7.14.1.1).”
Implementation: Application defined.
ISO Standard: “Signal values other than \texttt{SIGFPE}, \texttt{SIGILL}, and \texttt{SIGSEGV} that correspond to a computational exception (7.14.1.1).”

Implementation: Application defined.

ISO Standard: “Whether the last line of a text stream requires a terminating new-line character (7.19.2).”

Implementation: Yes.

ISO Standard: “Whether space characters that are written out to a text stream immediately before a new-line character appear when read in (7.19.2).”

Implementation: Yes.

ISO Standard: “The number of null characters that may be appended to data written to a binary stream (7.19.2).”

Implementation: No null characters are appended to a binary stream.

ISO Standard: “Whether the file position indicator of an append-mode stream is initially positioned at the beginning or end of the file (7.19.3).”

Implementation: Application defined. The system level function \texttt{open} is called with the \texttt{O_APPEND} flag.

ISO Standard: “Whether a write on a text stream causes the associated file to be truncated beyond that point (7.19.3).”

Implementation: Application defined.

ISO Standard: “The characteristics of file buffering (7.19.3).”

ISO Standard: “Whether a zero-length file actually exists (7.19.3).”

Implementation: Application defined.

ISO Standard: “The rules for composing valid file names (7.19.3).”

Implementation: Application defined.

ISO Standard: “Whether the same file can be open multiple times (7.19.3).”

Implementation: Application defined.

ISO Standard: “The nature and choice of encodings used for multibyte characters in files (7.19.3).”

Implementation: Encodings are the same for each file.

ISO Standard: “The effect of the \texttt{remove} function on an open file (7.19.4.1).”

Implementation: Application defined. The system function \texttt{unlink} is called.
ISO Standard: "The effect if a file with the new name exists prior to a call to the rename function (7.19.4.2)."

Implementation: Application defined. The system function link is called to create the new filename, then unlink is called to remove the old filename. Typically, link will fail if the new filename already exists.

ISO Standard: "Whether an open temporary file is removed upon abnormal program termination (7.19.4.3)."

Implementation: No.

ISO Standard: "What happens when the tmpnam function is called more than TMP_MAX times (7.19.4.4)."

Implementation: Temporary names will wrap around and be reused.

ISO Standard: "Which changes of mode are permitted (if any), and under what circumstances (7.19.5.4)."

Implementation: The file is closed via the system level close function and re-opened with the open function with the new mode. No additional restriction beyond those of the application defined open and close functions are imposed.

ISO Standard: "The style used to print an infinity or NaN, and the meaning of the n-char-sequence if that style is printed for a NaN (7.19.6.1, 7.24.2.1)."

Implementation: No char sequence is printed.

NaN is printed as “NaN”.

Infinity is printed as “[/-+]Inf”.

ISO Standard: “The output for %p conversion in the fprintf or fwprintf function (7.19.6.1, 7.24.2.1).”

Implementation: Functionally equivalent to %x.

ISO Standard: “The interpretation of a - character that is neither the first nor the last character, nor the second where a ^ character is the first, in the scanlist for %[ conversion in the fscanf or fwscanf function (7.19.6.2, 7.24.2.1).”

Implementation: Unknown

ISO Standard: “The set of sequences matched by the %p conversion in the fscanf or fwscanf function (7.19.6.2, 7.24.2.2).”

Implementation: The same set of sequences matched by %x."
ISO Standard: “The interpretation of the input item corresponding to a `%p` conversion in the `fscanf` or `fwscanf` function (7.19.6.2, 7.24.2.2).”

Implementation: If the result is not a valid pointer, the behavior is undefined.

ISO Standard: “The value to which the macro `errno` is set by the `fgetpos`, `fsetpos`, or `ftell` functions on failure (7.19.9.1, 7.19.9.3, 7.19.9.4).”

Implementation: If the result exceeds `LONG_MAX`, `errno` is set to `ERANGE`.

Other errors are application defined according to the application definition of the `lseek` function.

ISO Standard: “The meaning of the `n-char-sequence` in a string converted by the `strtod`, `strtof`, `strtold`, `wcstod`, `wcstof`, or `wcstold` function (7.20.1.3, 7.24.4.1.1).”

Implementation: No meaning is attached to the sequence.

ISO Standard: “Whether or not the `strtod`, `strtof`, `strtold`, `wcstod`, `wcstof`, or `wcstold` function sets `errno` to `ERANGE` when underflow occurs (7.20.1.3, 7.24.4.1.1).”

Implementation: Yes.

ISO Standard: “Whether the `calloc`, `malloc`, and `realloc` functions return a null pointer or a pointer to an allocated object when the size requested is zero (7.20.3).”

Implementation: A pointer to a statically allocated object is returned.

ISO Standard: “Whether open output streams are flushed, open streams are closed, or temporary files are removed when the `abort` function is called (7.20.4.1).”

Implementation: No.

ISO Standard: “The termination status returned to the host environment by the `abort` function (7.20.4.1).”

Implementation: By default, there is no host environment.

ISO Standard: “The value returned by the `system` function when its argument is not a null pointer (7.20.4.5).”

Implementation: Application defined.

ISO Standard: “The local time zone and Daylight Saving Time (7.23.1).”

Implementation: Application defined.

ISO Standard: “The era for the `clock` function (7.23.2.1).”
Implementation Defined Behavior

Implementation: Application defined.

ISO Standard: “The positive value for tm_isdst in a normalized tmx structure (7.23.2.6).”

Implementation: 1.

ISO Standard: “The replacement string for the %z specifier to the strftime, strfxttime, wcsftime, and wcfxftime functions in the “C” locale (7.23.3.5, 7.23.3.6, 7.24.5.1, 7.24.5.2).”

Implementation: Unimplemented.

ISO Standard: “Whether or when the trigonometric, hyperbolic, base-e exponential, base-e logarithmic, error, and log gamma functions raise the inexact exception in an IEC 60559 conformant implementation (F.9).”

Implementation: No.

ISO Standard: “Whether the inexact exception may be raised when the rounded result actually does equal the mathematical result in an IEC 60559 conformant implementation (F.9).”

Implementation: No.

ISO Standard: “Whether the underflow (and inexact) exception may be raised when a result is tiny but not inexact in an IEC 60559 conformant implementation (F.9).”

Implementation: No.

ISO Standard: “Whether the functions honor the rounding direction mode (F.9).”

Implementation: The rounding mode is not forced.

A.18 ARCHITECTURE

ISO Standard: “The values or expressions assigned to the macros specified in the headers <float.h>, <limits.h>, and <stdint.h> (C90 and C99 5.2.4.2, C99 7.18.2, 7.18.3).”

Implementation: See Section 1.5.6 “limits.h”.

ISO Standard: “The number, order, and encoding of bytes in any object (when not explicitly specified in the standard) (C99 6.2.6.1).”

Implementation: Little endian, populated from least significant byte first. See Section 1.5 “Data Storage”.

ISO Standard: “The value of the result of the sizeof operator (C90 6.3.3.4, C99 6.5.3.4).”

Implementation: See Section 1.5 “Data Storage”.
Appendix B. Open Source Licensing

B.1 INTRODUCTION

This chapter gives a summary of the open source licenses used for portions of the MPLAB C32 C compiler package.

B.2 GENERAL PUBLIC LICENSE

The executables for the compiler, assembler, linker, and associated binary utilities are covered under the GNU General Public License. See the file doc/COPYING.GPL in the product installation directory for the full text of the license.

B.3 BSD LICENSE

Portions of the standard library are distributed under the terms of the “BSD” license from the University of California:

Copyright © Regents of the University of California.
All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. All advertising materials mentioning features or use of this software must display the following acknowledgement:
This product includes software developed by the University of California, Berkeley and its contributors.

4. Neither the name of the University nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE REGENTS AND CONTRIBUTORS “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE REGENTS OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT
LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

B.4 SUN MICROSYSTEMS

Portions of the standard library are copyright Sun Microsystems and are distributed under the permissions granted by the following terms:

Developed at SunPro, a Sun Microsystems, Inc. business. Permission to use, copy, modify, and distribute this software is freely granted, provided that this notice is preserved.
